Opponents and successors of the Xanthian dynasty in Western Lycia:
The Weχssere questions reconsidered

Wilhelm MÜSELER*  

Introduction

The publication of the book on Lycian coins in European private collections by the present author is approaching its third anniversary1. As expected, it has already sparked a number of interesting discussions regarding some of its central tenets. The attribution of the main text from the famous Xanthos-Stele to Xerēi, once more emphasized in a recent article by the author and by his colleague Diether Schürr2, has found broad support and was strengthened by a new analysis of the stoichedon rules applied to the inscription by Helmut Lotz3.

However, questions regarding the number and the role of the dynasts, who have been issuing coins that carry either the full or abbreviated personal name Weχssere or legends of a somewhat related form such as Waχsseblimi, Waχssepddimi or Uχssepddimi, have caused considerable confusion. The original hypothesis, brought forward by Kenneth Jenkins4 and subsequently accepted by most scholars studying the archaic and classical coins of Lycia, had asserted that there were two individuals called Weχssere, possibly father and son, whose issues belonged to two distinct periods of Lycian coinage: The elder and far more numerous group is in several respects related to the light weight coinage of the dynast Kuprlli from mints in Western Lycia and therefore has to be dated to the middle of the 5th century BC. The younger, considerably smaller group is mainly formed by a number of heavier coins bearing the name of the dynast in alternation with the name of the mint place Zagaba in Central Lycia in the back5. These coins display on their reverses an impressive frontal bust of the goddess Athena wearing a triple crest attic helmet. It was modelled after a spectacular coin signed by the artist Eukleidas from Sicily, which was created during the final years of the 5th century BC in Syracuse and obviously reached quite a wide range of circulation fairly soon6. However, the Lycian imitations of this type can hardly have been struck before the end of the 5th or the beginning of the 4th century BC. There is yet another issue from Zagaba bearing the name Weχssere, which in accordance with the reformed Eastern Lycian coins

1 Müseler 2016.
3 Lotz 2017.
4 Jenkins 1959 had examined an obviously later coin bearing the name Weχssere (for the type see Figure 46), which had been acquired by the British Museum at the time, and had excluded its assignment to the issues of the 5th century BC for a number of stylistic and technical reasons.
5 The word ΠΠΠΠ or abbreviations thereof had long been considered as the personal name of another dynast by many previous scholars. But Kolb – Tietz 2001 has convincingly shown that this legend refers to a place and not to a person.
6 Rizzo 1946, pl. XLIII, 21; Tudeer 1913, p. 42, 59 – This is not the only case by far, where a coin from Syracuse has been imitated by an issue from the eastern Mediterranean basin: See for example Wahl 2017.
in the names of Trbbenimi and Perikle shows a lion-mask on the obverse and a triskeles with a monogram in the central ring on the reverse. This can hardly be earlier than the nineties of the 4th century BC. These heavier Central Lycian coinages are complemented by a single light weight issue bearing the full name Weχssere: It has a profile-head of Athena turned to the right on the obverses and a bust of Hermes wearing a winged petasos in an incuse circle on the reverses. Since there is quite a number of series of the same or of a similar type, contemporary and later, bearing the name of the southern harbour-town Patara at the mouth of the Xanthos-River in Western Lycia, the latter issue should be attributed to this place as well.

The older coinages with the name Weχssere or with abbreviations thereof are supplemented by a small number of issues bearing the name Waχssebllimi. Hitherto these series are only known by some isolated specimens, which are partly related to coins of light standard in the name of Kuprlli from unidentified places in Western Lycia, but a closer geographical location of the mints in question is not possible. Thus, the material basis is too narrow for definite conclusions regarding the relationship between the earlier Weχssere- and the Waχssebllimi-issues. But an apparent link between the two coinages can be demonstrated further below.

However, the coinages to be compared with the Weχssere-issues of the 4th century BC are far more numerous and varied. In Central Lycia there is mainly the huge number of contemporary coins with the name Mithrapata, possibly issued by more than one mint, and the series with the name Aruwātijesi from Zagaba, all aligned to the local heavy standard based upon a weight of ca. 9.8 g for the stater. In the area of the Xanthos valley there are even more issues available for comparison, which are all of the lighter western standard with an average stater-weight of ca. 8.4 g only. Some bear the legends Waχssepddimi, Uχssepddimi and Ddẽñtimi and can be assigned to Patara and to Tlos. But a considerable number of those coins do not show any personal name; their legends only mention the respective mint place (Patara, Tlos, Pinara, Xanthos, Araxa, Tymnessos) and display various symbols in the fields, probably as references to the issuing dynast. Moreover, there are some minor issues from the same period without any legend at all, which have nothing but symbols in their reverse-fields. A few of those can be identified by their type as coins from the harbour-town Telmessos in the far Northwest. But in any case, it remains the central matter for discussion, to which rulers the different symbols must be attributed.

In a paper presented 2015 at the XV. International Numismatic Congress in Taormina the author had claimed that the variously attested appellations Waχssepddimi and Uχsepddimi would both refer to the younger Weχssere combining his personal name with a surname or title of some kind. This was also assumed with regard to the elder Weχssere for the legend Waχssepddimi on some coins apparently belonging to his period and for the Waχssepddimi mentioned on the Inscribed

7 Vismara 1989, p. 98 sq had annexed this issue in disregard of the obvious differences in style and fabric as type XIII to the series of the elder Weχssere from the middle of the 5th century BC. That this was a mistake is easy to see and has already been discussed: Cfr. Müseler 2016, p. 22 sq.
8 For the general importance of monograms or linear symbols on Lycian coins see Müseler 2016, p. 27 sqq.
9 Müseler 2017 b. Unfortunately, the editors of the Proceedings of this Congress have completely messed up the plate with the illustrations for the article, thus making the central argument of the paper more difficult to understand.
10 A similar though somewhat different construction had been proposed by Özüdoğru 2007.
Pillar of Xanthos. The author has expressed the same view in his book on Lycian coinage of 2016.

This hypothesis has brought forward considerable criticism from several other scholars. Koray Konuk and Diether Schürr have expressed serious doubts regarding the underlying onomastic construction. Instead they have asserted that all the personal names in their various forms and spellings, as they appear on the coins and on the stele, should be seen as referring to separate individuals. Given the formal similarity of all those names Konuk and Schürr have supposed that their bearers might have belonged to one large family. Thus, a whole clan of dynasts was conjectured, whose members – during two distinct periods and with an intermission of almost forty years – ruled more or less at the same time or in close succession to each other at some places in Western Lycia, namely in Patara and in Tlos. However, this construction fails to explain a number of manifest connections such as die-links between the coinages in question and takes the evident significance of the monograms placed on many of the coins not into account as will be shown below. From a numismatic point of view, it leaves too many questions open and is by far not as conclusive as it may appear.

An alternative model, which is actually quite amusing, was presented by Frank Kolb in his recent book on the history and archaeology of Lycia. In the opinion of Kolb all the coins bearing the name Weyssere should belong to one and the same dynast. First, he would have been the issuer of all the early series minted in Western Lycia in succession to the rule of Kuprilli; then he would have disappeared from the scene for quite a long time, only to re-emerge after a couple of decades in Central Lycia and in the Xanthos valley in order to reinstate another (and completely different) coinage in his name there, which would finally last well into the 4th century BC. Under this assumption one and the same person called Weyssere would have issued coins in both Western and Central Lycia over a period of approximately fifty years or even longer. Of course, this is not entirely impossible, but it requires at least an explanation for the long intermitting period,
which Kolb unfortunately fails to provide. Even worse is the fact that this construction is in defiance of basic numismatic method as adopted by Jenkins when dividing the coins bearing the name Weχssere into two distinct groups: Coinages clearly belonging to two separate periods should be assigned to separate issuers, even if those happen to bear identical names, unless there is substantial proof to the contrary.

In fact, none of the hypothetical solutions for the Weχssere-problem brought forward up to this point (the one of the authors included) is really satisfactory. As pointed out above there is a considerable number of coins, which bear witness to the time immediately preceding and following the rule of the later part of the “Dynasty of Xanthos”, i.e. of Xeriga and his successors including the usurper Erbbina. The information, which they carry about the identity and the function of the rulers from the alleged Waχssa-clan and of others from the same political context is certainly not complete and sometimes not easy to discover or to interpret, but it is still of great significance. Some of the series in question are quite large and well documented, but of others there are only a few examples known and sometimes there is even just one single specimen left. The widely scattered examples must be once again assembled and studied as a whole in order to detect possible interconnections, which are of importance for the sequence of the various coinages and/or for the identity and the political position of their issuers. Therefore, it is the main purpose of this article to gather the relevant numismatic evidence regarding the time and the ambit of the dynasts named Weχssere as completely as possible. Particular emphasis will be laid on the study of the various symbols appearing in the fields of most coins, - an additional medium of information, whose importance and function has been widely underestimated so far. Thus, we may possibly gain some valuable clues leading to a better understanding of the role of these agents in the history of Lycia.

The aftermath of Kuprllis reign in the West: Weχssere and Waχssebllimi

The present catalogue of the coin issues attributable to the elder Weχssere resumes and amends Novella Vismara’s attempt of 1989 to form a corpus of the respective coinage. However, it disregards minor die-variations, which do not serve the purpose of this article, and is only focussed on the principal types. In an appendix at the end the few examples of the coinage with the name Waχssebllimi or abbreviations thereof, which are known so far, are listed:

I.1.1. Diobol (Sixth stater), uncertain mint. Lion crouching to l., in field above linear symbol ₞ / Triskeles in incuse square, in field legend ΦΔΨ
Vismara 2; SNG Cop. Suppl. 436* (1,15 g)  
(Figure 1)
I.1.2. Stater, uncertain mint. Lion jumping to r. with head reverted / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \downarrow \)
Vismara - ; Müseler V,2* (8,01 g)  
(Figure 2)

I.1.3.a Tetrobol (Third stater), uncertain mint. Lion crouching to r. on round shield, above \( <\op> \) / Triskeles in incuse square, in field legend \( F^\Uparrow V \downarrow \downarrow \downarrow \uparrow \uparrow \)
Vismara 4; Winsemann-Falghera Coll. 144* (2,63 g)  
(Figure 3)

I.1.3.b Obol (Twelfth stater), uncertain mint. Lion crouching to r., in front \( <\op> \) / Triskeles in incuse square, in field legend \( F^\Uparrow V \downarrow \) (sic!)
Vismara 7; Winsemann.Falghera Coll. 146 (0,54 g)

I.1.4. Stater, uncertain mint. Protome of winged lion to l. / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \downarrow \)
Vismara 8; Müseler V,3* (8,50 g)  
(Figure 4)

I.1.5. Stater, uncertain mint. Protome of winged boar to l. on round shield / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \downarrow \downarrow \downarrow \)
Vismara 13; Auction Roma XVI, 2018, 316* (8,39 g)  
(Figure 5)

I.1.6.a Stater, uncertain mint. Protome of pegasus to l. on round shield, above \( <\op> \) / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \downarrow \downarrow \)
Vismara 22; Müseler V,4* (8,42 g)  
(Figure 6)

I.1.6.b Tetrobol (Third stater), uncertain mint. Protome of pegasus to l. on round shield, above \( <\op> \) / Triskeles in incuse square, in field legend \( F^\Uparrow V \)
Vismara 25; SNG Cop. Suppl. 435 (2,40 g)

I.1.7.a Stater, uncertain mint (Telmessos?). Herakles walking to l., head reverted, carrying club and tripod / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \downarrow \downarrow \downarrow \uparrow \uparrow \)
Vismara 29; Müseler V,19* (8,43 g)  
(Figure 7)

I.1.7.b Diobol (Sixth stater), uncertain mint (Telmessos?). Herakles walking to l., head reverted, carrying club / Triskeles in incuse square, in field legend \( F^\Uparrow V \)
Vismara 30; McClean 8869 (1,21 g)

I.1.8.a Stater, uncertain mint (Tlos?). Head of Athena with korinthian helmet to r./ Diskeles in incuse square, in field legend \( F^\Uparrow V \downarrow \downarrow \downarrow \uparrow \uparrow \)
Vismara - ; Müseler -; Auction Roma XVI, 2018, 314* (8,54 g)  
(Figure 8)

I.1.8.b Tetrobol (Third stater), uncertain mint (Tlos ?). Head of Athena with korinthian helmet to r. / Diskeles in incuse square, in field legend \( F^\Uparrow V \downarrow \downarrow \downarrow \uparrow \uparrow \)
Vismara 48; ANS (New York) 1987.89.8 (2,81 g)

I.1.8.c Stater, uncertain mint (Tlos?). Head of Athena with korinthian helmet to r. / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \downarrow \downarrow \downarrow \uparrow \uparrow \)
Vismara 35; Müseler V,12* (8,24 g)  
(Figure 9)

I.1.8.d Tetrobol (Third stater), uncertain mint (Tlos?). Head of Athena with korinthian helmet to r. / Triskeles in incuse square, in field \( <\op> \) and legend \( F^\Uparrow V \)
Vismara 41; Müseler V,13 (2,68 g)
I.1.8.e Diobol (Sixth stater), uncertain mint (Tlos?). Head of Athena with korinthian helmet to r. / Triskeles in incuse square, in field $\Diamond$ and legend $F^{\uparrow}\\\\\psi$ Vismara 44; Müseler V,16 (1,33 g)

I.1.9.a Stater, uncertain mint (Xanthos?). Head of Athena with attic helmet to r., on the crest (occasionally) legend $F^{\uparrow}\\\\\psi$ / Head of Apollon with laurel-wreath to r. in incuse square, in field $\Diamond$ Vismara 52; Müseler V,7 (8,38 g) (Figure 10)

I.1.9.b Tetrobol (Third stater), uncertain mint (Xanthos?). Head of Athena with attic helmet to r. / Head of Apollon with laurel-wreath to r. in incuse square, in field $\Diamond$ Vismara 56; Müseler V,10 (2,87 g)

I.1.9.c Diobol (Sixth stater), uncertain mint (Xanthos?). Head of Athena with attic helmet to r. / Head of Apollon with laurel-wreath to r. in incuse square, in field $\Diamond$ Vismara 62; Müseler V,11 (1,40 g)

I.1.9.d Obol (Twelfth stater), uncertain mint (Xanthos?). Head of Athena with attic helmet to r. / Head of Apollon with laurel-wreath to r. in incuse square, in field $\Diamond$ Vismara 63; Winsemann-Falghera Coll. 162 (0,68 g)

I.1.10. Stater, uncertain mint (Xanthos?). Head of Apollon with laurel-wreath to r. / Triskeles in incuse square, in field $\Diamond$ and legend $F^{\uparrow}\\\\psi$ Vismara 66; Auction Hess/Divo 329, 2015, 103* (8,58 g) (Figure 11)

I.1.11. Stater, uncertain mint. Head of a Kabeiros (?) with conical cap to r. / Triskeles in incuse square, in field legend $F^{\uparrow}\\\psi$ (retrograd) Vismara 70; Babelon, Traité II/2, 426 = BM 1863,0706.17* (7,90 g) (Figure 12)

I.2.1.a Stater, uncertain mint. Mule kneeling to l., head reverted, above linear symbol $\Upsilon$ / Triskeles in incuse square, in field legend $F^{\uparrow}\\\psi$ Vismara -; Müseler V,1* (7,88 g) (Figure 13)

I.2.1.b Tetrobol (Third stater), uncertain mint. Mule kneeling to l, head reverted, above linear symbol $\Upsilon$ / Triskeles in incuse square, in field legend $F^{\uparrow}\\\psi$ Vismara 3; Babelon, Traité II, , 432 = BN btv 1b 8534854p* (2,31 g) (Figure 14)

I.2.1.c Diobol (Sixth stater), uncertain mint. Mule kneeling to l, head reverted, above linear symbol $\Upsilon$ / Triskeles in incuse square, in field legend $F^{\uparrow}\\\psi$ Auction Naumann (Pecunem) 14, 2014, 363 (1,00 g)

I.2.1.c Obol (Twelfth stater), uncertain mint. Mule kneeling to l., head reverted, above linear symbol $\Upsilon$ / Triskeles in incuse square, in field legend $F^{\uparrow}\\\psi$ Vismara 4; Winterthur G 4251 (0,42 g)

I.2.2. Stater, uncertain mint (Patara?). Bearded head of Hermes (?) with winged petasos to r. on round shield / Triskeles in incuse square, in field linear symbol $\Upsilon$ and legend $F^{\uparrow}\\\psi$ Vismara -; Müseler -; Auction Gemini VII, 2011, 546* (8,65 g) (Figure 15)
Apart from the enormous difference in their sizes the coinages in the name of Wexssere and of Waχssebllimi display several parallel features. Regarding iconography both groups contain issues clearly related to types introduced by the Western coinage of Kuprlli. This is true for the jumping lion and the winged lion-protome on coins bearing the legend Wexssere and the kneeling-running mule on others with the legend Waχssebllimi (see Figure A-C). Even so some completely new motifs are introduced as well: The helmeted heads of the goddess Athena on coins in the name Wexssere, which are directly copied from contemporary issues of Athens and possibly pointing to an Athenian allegiance of their issuer (Figure D), and the highly unusual bearded head of Hermes on a stater with the legend Waχssebllimi are both without precursor in earlier Lycian coinage.

Furthermore, similar to the majority of issues in the name of Kuprlli there is no indicator to any specific place of origin provided by the legends on the coins. In some cases possible mints can be inferred by a comparison of certain typological features with those from later series that carry a toponym in addition to or in place of the personal names: References to the myth of Herakles are usually associated with the mint at Telmessos near the Carian border (Figure E-F). An enlarged linear symbol in place of any pictorial reverse-type or of a triskeles can occasionally be found on coins from Tlos (Figure G-H). The combination of a helmeted head of Athena on the obverse with a head of Apollon in the back appears on later anonymous issues with the toponym of Xanthos (Figure 78). And the head of Hermes with a winged petasos is displayed (though un-bearded) on later issues bearing the place-name of Patara and occasionally also that of Tlos (Figure 48 and 125). However, an attribution of coins with the legends Wexssere or Waχssebllimi to respective mints must remain mostly hypothetical.

An outstanding common feature of both coinages discussed here is the almost uniform addition of certain linear symbols in the fields, either beside the various obverse-types or beside the personal names on the reverses: With only two exceptions all the issues with the name Wexssere are adorned with a diskeles (⊙) somewhere in the field, while on the coins with the name Waχssebllimi we always find a V-shaped symbol (V). On first sight this distinction seems to be continuous, but it is not. The issue with the crouching lion to the left, which is only preserved in small denominations so far but which definitely belongs to the Wexssere-group, carries the symbol τ and not the diskeles in the field above the animal. Possibly this issue forms a bridge between the two groups; but as pointed out above with only such a few specimens of the coinage bearing the name Waχssebllimi extant the material base is far too narrow to allow valid conclusions regarding the identity of that ruler and his relationship to the issuer of the far larger series of coins with the name Wexssere.

An additional problem is posed yet by the appearance of the name-form Waχssepddimi in the account of the deeds of Xerēi on the Xanthos-Stele. The person in question is listed among the enemies beaten by the army of Xerēi at the same time or soon after the expedition of the Athenian

---

21 The enlarged monogram ख, usually associated with rulers of the Xanthian-dynasty, has been repeatedly set on coin-issues from the mint at Tlos: See Mørkholm – Zahle 1976, p. 52, 47-49 and Babelon, Traité II/2, 412. For the Tloan origin of the latter issue see Müseler 2017 a, p. 6 sqq.

22 Vismara (communication by letter) considers this as another proof for the basic equivalence of the spelling F†... and F†... in Lycian, quoting as further examples the words arawzije / erawazije, Erkkazuma / Arkkazuma or mere-/mara-.
commander Melesandros into Lycia\textsuperscript{23}. This agent must therefore be dated to the same general period, from which the coin-series discussed here originate. In fact, it cannot be thoroughly excluded that we are dealing with three different individuals here, who bear strikingly similar names. But such a solution cannot claim a very high degree of probability in its favour, - in particular since the situation seems to repeat itself some forty years later after the end of Erbbina’s rule in the Xanthos valley and the extinction of the Xanthian dynasty\textsuperscript{24}.

Central Lycia during the final years of the Xanthian dynasty and afterwards: Weγssere, Mithrapata and Aruwätijesi

The coin-production of Central Lycia between the end of the 5\textsuperscript{th} and the early 4\textsuperscript{th} century BC is dominated by the series in the name of two dynasts, accompanied by an issue in the name of a clearly less important third. Moreover, it has to be divided into two distinct phases. Some time after 410 BC, when the Syracusan celator Eukleidas had designed his famous tetradrachm-die with the facing bust of the goddess Athena wearing a triple-crested helmet (Figure I), a new coinage of heavy weight standard was introduced at Zagaba in the eastern highlands of Central Lycia. The issuer was once more named Weγssere. The coins display on the obverse an impressive protome of a roaring lion turned to the left. Above there is a small legend consisting of the letters \textit{NZ}, which is yet unexplained. On the reverse there is quite a well-executed imitation of the masterpiece of Eukleidas. A presumably somewhat later issue shows a facing lion mask instead of the protome, while the facing bust of Athena on the reverse is kept. There is no longer any mention of the issuer. Instead the legend refers to Zagaba, the location of the mint. In addition there is the miniature-legend \textit{iAPa} placed on the visor of Athena’s helmet, possibly the signature of a die-cutter\textsuperscript{25}. On coins from both issues the monogram \textit{Φ} is set in the reverse-field.

At about the same time another coinage aligned to the same weight standard was issued by a dynast with the name Mithrapata. The coins carry a similar lion-protome (though turned to the right) on the obverse, which is likewise replaced by a frontal lion-mask later on. But instead of the facing bust of Athena there is the bearded head of an elderly man in profile wearing a diadem on the reverse, apparently a portrait of the issuer himself\textsuperscript{26}. In contrast to the issues of Weγssere the name of Mithrapata is never replaced by a toponym on his Central Lycian coinages; therefore the location of the mint cannot be identified with certainty. There are, however, good reasons for the assumption that the place of origin for Mithrapata’s portait coinage was the town of Phellos above

\textsuperscript{23} Kalinka TL 44, a 58-60. The alternative reading of these lines by David Sasseville (Sasseville NN) has been rejected by Müseler – Schürr 2018, p. 390.

\textsuperscript{24} See below p. 64.

\textsuperscript{25} Olcay – Mørkholm 1971, 11-12. The miniature legend on the helmet can obviously not be a toponym, since the main legend on the pieces already mentions Zagaba as the location of the mint. On the Sicilian model for this Lycian issue this discrete place was in fact reserved for the signature of the artist.

\textsuperscript{26} Portraits had been introduced into Lycian coinage (and coinage in general!) by an issue of Xeriga from Tymnessos (SNG Cop. Suppl. 441). Later also the other members of the later Xanthian dynasty (with the exception of Erbbina) made extensive use of their own image on their coinages. Cfr. Müseler 2016, p. 18 sqq.
the southwestern coast of the central region\textsuperscript{27}. The first series in the name of \textit{Weχssere} from Zagaba and of \textit{Mithrapata} from Phellos are probably more or less contemporary with the rule of \textit{Ddenewele} in Western Lycia and the conquest of power by the usurper \textit{Erbbina}\textsuperscript{28}.

After the introduction of a reformed coinage of similar weight standard but with a simplified iconography by the dynast \textit{Trbbenimi} at Limyra the new coin types were soon adopted in Central Lycia as well, presumably during the late nineties of the 4\textsuperscript{th} century BC. The coins show a facing lion mask on the obverse and just a large triskeles, often accompanied by monograms or various symbols, which will be discussed further below. There are a few issues of this type signed by \textit{Weχssere}, soon to be followed by the small Central Lycian coinage of \textit{Aruwãtijesi}. The bulk of this reformed coinage, however, bears the name of \textit{Mithrapata}. Thereby it remains uncertain, whether these coins replaced his earlier issues entirely or whether the production of coins bearing his portrait was nonetheless continued. Possibly the reformed coinage of \textit{Mithrapata} was no longer struck at Phellos but also at Zagaba, which might have passed under his control after the short reign of \textit{Aruwãtijesi} at that place.

Moreover there are two isolated issues from the small town of Tymnessos near the mountain-pass between Central Lycia and the Xanthos valley, – one with the monogram of \textit{Weχssere} and the abbreviated toponym and the other in the name of \textit{Mithrapata} together with the full name of the mint-place. The two issues are of similar type but only vaguely related to each other; they are almost certainly produced at different occasions.

Although an approximate chronological sequence can be established for the main-issues the following catalogue of the Central Lycian issues will be arranged by the different mints. Unless stated otherwise this will be maintained as the guiding principle for the order of the material presented in subsequent sections of this article.

| II.1.1.a | \textit{Weχssere}. Stater, [Zagaba] Protome of lion to l., above legend $\mathcal{V}^\uparrow$ / Bust of Athena with triple-crested attic helmet facing in incuse circle, in field legend $\mathcal{F}\uparrow\mathcal{F}^\uparrow\mathcal{F}^\uparrow$ Olçay – Mørkholm 1971, 1 = Müseler VII, 1* (9,89 g) (Figure 16) |
| II.1.1.b | \textit{Weχssere}. Tetrobol (Third stater), [Zagaba] Head of lion to r., above legend $\mathcal{F}^\uparrow\mathcal{V}$ / Head of Athena with triple-crested attic helmet facing in incuse circle, in field monogram $\mathcal{F}$ and legend $\mathcal{F}^\uparrow\mathcal{V}^\downarrow$ Winsemann-Falghera Coll. 186* (2,85 g) (Figure 17) |
| II.1.1.c | \textit{[Weχssere]}. Tetrobol (Third stater), [Zagaba] Head of lion to r. / Head of Athena with triple-crested attic helmet facing in incuse circle, in field monogram $\mathcal{F}$ SNG v. Aulock 4211 (2,89 g) |

\textsuperscript{27} Phellos is actually suggested by its subsequent use as the mint for the coinage of \textit{Perikle} displaying his famous frontal-portrait (Müseler 2016, VIII, 35 and below Figure O).

\textsuperscript{28} For the date and the importance of the reign of \textit{Ddenewele see Müseler 2017a}.
II.1.2.a  *[Weχssere]. Stater, Zagaba

IV.2.1.  *Mithrapata*. Stater, Tymnessos

Head of Athena with korinthian helmet to l., in field Ν / Bull butting to l. in incuse square, in field legend ΒΕΥΧΕΠΠΣΠΤ ΤΟΜΕΝΥΟ

SNG Keckman II, 492* (8.41 g)  (Figure 42)

On the initial, “pre-reform” issues of *Weχssere* and of *Mithrapata* the usage of monograms and symbols follows the same pattern that can be observed among earlier coinages: The majority of *Weχssere’s* coins with the frontal bust of Athena from Zagaba and two of the coins with the bull from Tymnessos carry a monogram composed of the Lycian letters Ο, Ψ and Φ, which is possibly to be understood as a (though somewhat unusual) abbreviation of the beginning of the issuers name. Apparently, it is generally used as a substitute of the dynast’s name on issues that bear only a reference to the location of the mint, a peculiar feature that will gain importance in the analysis of the anonymous issues from the Xanthos valley later on29. All the earlier coins of *Mithrapata*, that is both groups displaying his portrait from the mint of uncertain identification, but also a fraction from his “post reform” coinage and the single issue in his name from Tymnessos, carry a small triskeles (⁞) in their fields as a distinctive mark30. Although *Mithrapata’s* name has been nowhere omitted, this sign seems to have likewise served as some kind of personal emblem, which allowed the identification of the respective issuer by users of the coins, who were not able to read the legends.

A combination of the dynast’s name with the monogram ◁ is also applied on *Weχssere’s* “post-reform” issues from Zagaba. There are, however, two different variants of the personal name conveyed by the legends of those coins, ΧΨΨΨΨΨΨΨΨ and ΨΨΨΨΨΨΨΨ (Figure 26 and 27). Together with the accompanying monogram that can be spelled out as ΩΨΦ this probably accounts for a basic equivalence in the use of the various spellings rather than for three basically different names born by more than one individual31. Anyway, the entire post-reform coinage of *Weχssere* seems comparatively small. It is followed by the also not exactly numerous issues in the name of *Aruwãtijesi*, which do not bear an additional symbol. Instead some of *Aruwãtijesi’s* coins show the single letter Ι beside the dynast’s name in the field, - the initial of the mint-place Zagaba (Figure 23). Evidently it had become a requirement to underline the provenance of the issues, since this was no longer apparent from the pictorial type of the coins. Later on, this practice would be resumed by the coinage in the name of *Trbbenimi* at Zagaba (Figure J).

But on the post reform coinage of *Mithrapata* the character and the function of the secondary signs, which accompany the principal type of his coins, underwent a fundamental change. After a number of initial issues without any additional mark or with *Mithrapata’s* customary emblem of a small triskeles (Figure 30) various miniature images, pictorial representations of human figures, of animals or of inanimate objects, appear in the reverse-fields beside the large triskeles and the issuers name. So far, the purpose of this innovation is not entirely clear. Some of those figures,

---

29 See below p. 47 sqq.

30 The distinctive mark ◁ had already been used on the coins of *Kuprlli*, apparently for the same purpose.

31 This assumption has been opposed by Schürr 2018, who would expect to see positive proof from the numismatic or epigraphic record for the usage of the name-forms *Weχssere* or *Υξσσερε*, which is admittedly not attested so far, before accepting the idea of a basic equivalence of the different spellings suggested here. The author, however, is convinced that the material extant already provides sufficient evidence to permit such a conjecture.
namely the helmeted head of Athena or the facing busts of Hermes and of Heracles (Figure 33 and 35-36), seem to be allusions to images used for the coinages from mints further to the West such as Xanthos, Patara or Telmessos. Given their principal type and their weight standard the coins in question can, however, neither have been struck in the West, nor can they have been meant to supplement or to replace the respective Western issues in any way. Apparently, they have been all made by one and the same mint that is to be located in Central Lycia. The application of such images on otherwise completely regular Central Lycian coins was presumably meant to emphasize the issuers claim to rule over all of Lycia, in particular including the Xanthos valley. The coins might actually have been produced with the intention to finance a larger military operation in the West.

A military background may perhaps also be conjectured for the re-opening of the mint at Tymnessos in the mountains near the eastern border of the Xanthos valley. It was used for the production of some small series adapted to the lighter weight-standard of western Lycia by Mithrapata and by Weכס.erase (Figures 40-42), – though presumably not at the same time. Only at the time of the elder Weכס.sere a couple of issues in the name of Xeriga had been minted there before, most likely in preparation of the dynasts campaign from his bases at Phellos and at Kandyba against the regions to the West that eventually led him to the capture of Xanthos (Figure K-L). Perhaps the mint at Tymnessos was only operational in times of war. For the younger Weכס.sere the occasion might well have been a campaign against the tyrant Erbbina, which lead to the ultimate demise of the latter, while a possible expedition of Mithrapata into the Xanthos valley would have to be dated somewhat later.

New rulers in the West (Waכס.sebddimi, Dדнтими, Weכס.sere and Aruwåtijesi)

Although it is not possible to fix an absolute chronology for the series listed and discussed in this section an internal sequence of the coinages from the various mints may actually be deduced from properties of the material: Most likely the issues from Patara begin somewhat earlier than the ones from Tlos. The latter might be more or less contemporaneous with those from Telmessos and the few issues that can be attributed either to Xanthos or to Pinara. Inside the respective groups the sequence of series in the name of the different issuers can also be demonstrated, though to a limited extent. At Telmessos it can be proved by shared obverse-dies that the coins of Aruwåtijesi (Figures 59-60) immediately succeed and replace the issues in the name of Erbbina at the former stronghold of the usurper outside the Xanthos valley (Figures M-N) and are then followed by issues with the respective monograms used by Waכס.sepddimi and by Dדнтימי. At Tlos the coins with the legend Waכס.sepddimi apparently precede those with the legend Dדнтימי, as will be shown further below. Only the sequence of the Waכס.sepddimi-, the Uכס.sepddimi- and the Weכס.sere-series from Patara, which certainly precede the various issues with the name of the mint

32 It should be noted that the coinage from Patara with the bust of Hermes must have preceded the respective Central Lycian issues of Mithrapata, if this assumption is correct. See below p. 44.

34 See Müseler 2016, p. 65 and Müseler 2017a, p. 15.

35 See further below p. 57.

36 One of the dies had even been used under Dデンewele before being employed for the coinage of Erbbina and then – after some repair – for the one of Aruwåtijesi: See Müseler 2017a, p. 11 with notes 20-21.
alone, cannot be established by an analysis of the coins themselves and must potentially rely on other evidence.

Müseler VII, 9⁺ (0,60 g)  (Figure 64)

VIII.2.1. [Waχssepddimi], Obol (Twelfth stater), [Xanthos or Pinara?]
Head of Athena with attic helmet to l. / Female head with taenia to l. in incuse circle, in field monogram or linear symbol
Roma E-Auction 35, 2017, 310⁺ (0,59 g)  (Figure 65)

All the coins presented here are adapted to the light weight standard with an average weight of ca. 8,5 g for the stater, which has been customary for all coinages produced in or for western Lycia since the time of Kuprlli³⁸. In addition the issues generally follow the denominational sequence of the attic system introduced in the Xanthos valley by Xeriga.

It is not certain, whether a mint had previously existed at Patara or whether it was a new installation for the production of the coinages in the name of Waχssebllimi and of Weχssere³⁹. In any case there had been no active mint at this place during the reigns of Xeriga, Xerẽi and Ddenewele. The distinctive type chosen for the coinages of Patara, a youthful bust or a head of Hermes turned to the right side wearing a flat and usually winged petasos, resembles in some respect the bearded head of Hermes set upon one earlier coin bearing the legend Waχssebllimi (Figure 15), but there no reference is given to any place of minting. The issues from Patara differ significantly from all the other coinages presented in this section: While the legend Waχssepddimi is also found on coins from the mint of Tlos, the name-forms Weχssere and Uχssepddimi appear only here. Moreover, the issue with the legend Uχssepddimi is the first example for the appearance of a personal name in combination with a toponym on a coin from Western Lycia since the time of Xerẽi, – an important exception being the stater in the name of Tissaphernes from Xanthos⁴⁰. This can hardly be seen as a result of mere chance; there must have been a specific reason for this step: Evidently the act of making the responsible dynast together with the place of origin of this coinage known through a clear and unambiguous statement on

³⁸ Despite being situated in the western part of Central-Lycia the coinages from Tymnessos as well as those from Kandyba were aligned to the light weight standard in force in the Xanthos Valley: See Müseler 2018, p. 17 sqq.
³⁹ For the assumption that Waχssepddimi and Uχssepddimi have been nothing else than spelling-variants of the same word see above p. 39 and note 31.
⁴⁰ SNG Cop.Suppl. 460. Here the joint mention of the satrap’s name and of the mint-location clearly served to emphasize the extraordinary character of the issue and to reflect intelligible to all a particular political situation.
one and the same coin had been deemed necessary, which speaks for the new and unprecedented character of these issues\(^\text{41}\).

Furthermore no monograms or symbols have been placed on these initial issues struck at Patara. This concerns not only the coins bearing personal names but also those that denote only the place of minting. It is in sharp contrast to the practice of most other mints, where such monograms or symbols are occasionally even applied as the only reference at all to the origin of the coinage and/or the person of the issuer\(^\text{42}\). The apparent lack of such distinctive marks could once more demonstrate that the Patarean coinage was a completely new production, where no reference to visual conventions introduced previously would make sense. Symbols or additional attributes like for example a kerykeion in the field beside the bust of Hermes were only used for later issues from the mint at Patara\(^\text{43}\).

There is a significant die-link that is connecting two of the issues from Patara presented above: The obverse die of most known coins in the name of Weχssere has also been used for the coin with the legend Waχssepddimi (Figures 45 and 46); unfortunately, the die shows in both cases approximately the same grade of wear so that an internal sequence of the respective issues cannot be established. But for the coins in the name of Weχssere and for the ones with the legend Uχssepddimi more than just one obverse die is known, what indicates a larger overall volume of those two series. However, an internal coherence of all the respective issues is attested by the described die-link.

There is only a small fraction of Patarean type that bears the the name Ddẽñtimi. No other coins from Patara with the name of that issuer are known so far. This is, however, in line with the main part of the coinage in the name of the same person from Tlos: Although more numerous these coins are also only Obols and Hemiobols. The only known stater with the name Ddẽñtimi is clearly dependent from a parallel issue of Waχssepddimi. This seems to indicate that Ddẽñtimi and his coinage were only of secondary importance; he might have been just a deputy of another, more powerful ruler.

In contrast to the Patarean coinages the Tloan issues make use of additional monograms or linear symbols: \(\Upsilon\) has been used on a number of issues with the legend Waχssepddimi, while \(\Delta\) is set on others usually referring to Ddẽñtimi. In most cases the symbols are added to the respective legends but on fractions they sometimes stand as single distinctive marks in the reverse-fields of the coins. On the only known stater-issue from Tlos bearing the legend Ddẽñtimi the monogram \(\Upsilon\) is even maintained and the mark \(\Delta\) is just added at the side (Figure 54). The obverse die of the said coin had previously been used for staters of the same type in the name of Waχssepddimi (see Figures 51 and 54), the sequence proved by the progressive wear of this die. Therefore, the group showing the legend Ddẽñtimi seems to have been subsequent to the one with the name Weχssere.

\(^\text{41}\) This becomes once more customary on the initial issues of Artumpara at Telmessos, Xanthos and Tlos (see below issues XX.1-4).

\(^\text{42}\) See for example the series with the Waχssepddimi-symbol beside the portrait of a dynast from Xanthos (Issue VIII.1.1.).

\(^\text{43}\) See below p. 57 sqq.
Waχsepddimi, although the chronological connection between the two coinages is obviously rather close. With respect to the very small number of dies known for the staters of both issues the minting-period of all those coins at Tlos has probably not been of a long duration.

The image jointly employed by both series features two opposed lions with raised paws. Those were possibly derived from a Central Lycian issue in the name of the dynast Xinaya datable to the mid 5th century BC and coming from an unidentified mint that is, however, probably to be located at Zagaba (Figure O)44. The dynasts making use of this reverse-type may well have been themselves of Central Lycian origin like Weχssere and Aruwātijesi; at least the coinage appears to be the reflection of a manifest relationship with that region. In any case this new coin type was kept and adopted by the dynast, who subsequently issued the anonymus series with just the toponym and a diskeles-symbol in the reverse-field at Tlos45.

While the coins that can be assigned to Waχsepddimi all seem to belong to one single series the typological range of the issues of Ddẽñtimi is somewhat larger: Beside the staters closely related to the coinage of Waχsepddimi there is another series, which combines a facing lion mask on the obverse with a youthful male head on the reverse and which is struck from a multitude of slightly differing dies. These coins do not only display the issuers name with the monogram X but even add the toponym like the issues with the legend Uχssepddimi from Patara. Perhaps users from beyond the immediate neighbourhood of Tlos were not very well acquainted with this coinage, which needed therefore to be equipped with multiple identification-marks in order to be acknowledged as a valid mean of trade elsewhere. However, although this issue judging by the number of dies employed for its production must have been massive there are only fractions known so far, and the question is, whether larger denominations of the same type have been existent at all.

At Telmessos the coin-types of Ddenewele and Erbbina had been temporarily replaced by a new design launched by Aruwātijesi, but this was subsequently once more abandoned. Issues carrying either the linear symbol of Waχsepddimi or the monogram of Ddẽñtimi make again use of the traditional pattern with the head of Herakles on the reverse. In contrast to all the mints in the Xanthos-valley these issues are not followed by any coinage with the name of the mint-location and the symbol 4Ø. The overall volume of the coinage from Telmessos seems to have dwindled considerably after the end of Erbbina’s rule. From this mint in the far north-western corner of the Lycian peninsula, which had been highly productive once, there are only a very few issues, known for the period under discussion attested by some single specimens left. The next more important coinage from this place seems to be the series in the name of Artumpara46.

But the most remarkable feature of the coinages discussed within the present section is the unusual distribution of the issues among the various mints of Western Lycia. There is just one issue that can be attributed with some certainty to the mint of Xanthos and another one that might as well have come from Pinara. The issue with the portrait of a bearded man wearing a headdress of Persian type that is additionally adorned with a diadem-band corresponds to an issue of Xerēi

44 See Müseler 2018, p. 23.
45 See below issues IX.1-2.
46 See issue XX.1.1. below.
from Pinara and even more to a Xanthian issue of Ddenewele (Figure P-Q)\textsuperscript{47}. Although there are some completely illegible signs or letters under the head of Athena on the obverse of the staters belonging to this series\textsuperscript{48} the only reference to the identity of the person depicted seems to consist in the linear symbol $\mathcal{O}$ beside the male head on the reverse, which points to the dynast named Waχssepddimi. The same symbol is set on the small coin with the female head that is possibly to be assigned to Pinara\textsuperscript{49}. But all this is far inferior to what would be expected from mints that had been installed so long ago and had produced coins in such significant numbers under the Xanthian dynasty. At the time of Erbbina the minting-activities in the lower Xanthos valley had apparently been interrupted and the production of coins had ceased for some time. When it was finally resumed dynastic names did no longer appear on the issues from Xanthos and Pinara. Only the places of origin continued to be mentioned, always accompanied by a small diskeles ($\mathcal{O}$) in the fields. The respective coinages will be presented and discussed on the following pages.

**The issuers of the anonymous “diskelophoric” coinages**

A coinage that displayed just the name of the mint-place and a small diskeles on the reverse was apparently initiated at Tlos at the same time or soon after the issues bearing the names Waχssepddimi or Ddẽntimi. Other mints in the lower Xanthos valley soon followed suit: At Xanthos and Pinara the traditional designs, which had been used for the coinages of the former Xanthian dynasty, were gradually abandoned and replaced by a variety of new motifs. From that moment onwards all the coins struck at these mints were only marked with the respective place-name and the symbol $\mathcal{O}$ in the field. On some fractions, otherwise clearly related to the same series, the toponym and sometimes even the small diskeles may occasionally be missing, but those cases are rather rare. However, at Patara the application of the symbol $\mathcal{O}$ remained an exception. Here coins showing the head of Athena in combination with the head of Hermes and naming the location while lacking the diskeles in the field, apparently continued to be struck throughout the entire period of the mint’s activity and formed the predominant mainstream of its production\textsuperscript{50}. But apart from these issues there exist a few series of a different type and endowed with a diskeles-symbol that must nonetheless also be attributed to Patara. The principal image of these coins, a facing head of Athena with a triple crested atti c helmet, is clearly related to the Central Lycian coinage of Weχssere from Zagaba, although the execution of the design is somewhat coarser here\textsuperscript{51}.

\textsuperscript{47} Winsemann–Falghera Coll. 178 and Zahle 1982, Pl. 17, 18. The erroneous reading of the legend on the latter coin as Krñna had still been maintained by Zahle but this has meanwhile been proved as obsolete: See Müseler 2016, p. 8 and VI, 67.

\textsuperscript{48} The signs or letters under the head of Athena are only visible on the coin from the BM quoted here and are quite heavily damaged; on the specimen from the von Aulock collection this part of the die is not on the flan. Unfortunately, even a close and repeated inspection of the BM piece has not led to a feasible interpretation so far.

\textsuperscript{49} For the “diskelophoric” coinage from Xanthos and from Pinara with such a female head see below issues X,1.4-5. as well as issue XI.1.1. and XI.1.3.

\textsuperscript{50} See issues V.4-7. above and issues XVI.2.1-3. below.

\textsuperscript{51} These western issues with the facing head of Athena do not provide any reference to their place of origin. However, one of the fractions is from the same obverse-die as a coin that carries a head of Hermes with an abbreviation of the toponym for Patara on the reverse. See Figures 98 and 99.
But in comparison with the bulk of the Patarean issues these series appear quite small. They probably belong to some kind of special edition, which had no lasting consequence for the main-coinages struck at Patara.

In any case, the symbol $\text{\textcopyright}^{\text{OP}}$ remains the common denominator of all the different issues listed in this section. The author has therefore chosen to call those the “diskelophoric” coinages. The chronological frame, which must be assigned to the coinages of this type, is remarkably broad: While early series showing this characteristic property are either parallel or immediately subsequent to the issues discussed in the previous section a similar coinage was still produced towards the very end of dynastic rule in Lycia, – that is as late as the time of Artumpara. The latter has made use of the diskeles symbol on some issues from Telmessos, which are otherwise signed with his personal name. Moreover, a later series that carries only a diskeles symbol instead of any legend is connected by die-link to a coin with Artumpara’s signature$^{52}$. On these coins the diskeles has apparently undergone a change from its original function as a personal identity-marker to a badge of legitimate political power in Western Lycia, similar to the monogram $\text{\textcopyright}$ first employed by the dynast Teththiwelbi at Phellus as his personal emblem but later on adopted by Xeriga and his successors as a general symbol for their claim to rule in the Xanthos valley$^{53}$. However, Artumpara can hardly have been responsible for the entire diskelophoric coinage. After all it had been him, who had re-introduced the application of the issuers personal name on the coins on a large scale. This must probably be seen as an attempt to make his own coinage easier to distinguish from the one of another issuers, who had made use of the same symbol for his coinage but had deemed the utilization of his personal name either not appropriate or not necessary.

The author therefore assumes that the anonymous diskelophoric coinages have to be divided in two different groups: The presumably somewhat earlier one consists of the coins of a powerful though unnamed issuer, who – analogous to the employment of the sign $\text{\textcopyright}$ by Wāxssepddimi and the monogram $\text{\textcopyright}$ by Ddēntimi – made use of the symbol $\text{\textcopyright}^{\text{OP}}$ as his personal emblem and a label for his coinage. The other one is formed by supplementary anonymous issues related to the series in the name of Artumpara. The border-line between the two is not always easy to be drawn. Anyway, such a division will be attempted (with due reserve) in the following list, which is otherwise once again arranged by the respective mint places:

**IX.1.1.a** Anonymous, Stater, Tlos

(Figure 107)

The series that have been attributed to the coinage of *Artumpara* will be discussed together with the signed issues of this dynasty later in this article.

In the present section priority must be given to an analysis of the vast majority of the diskelophoric issues and to an attempt to identify the dynasty responsible for their production. The most important mint-place for coins of this type was obviously Xanthos, closely followed by Tlos. Patara, though in possession of a quite active mint of its own, took only a small part in the production of the diskelophoric series, and the mint at Pinara had generally been of lesser weight.

This matches the picture that all sources convey regarding the “political geography” of the Xanthos valley during most of the 5th and the 4th century BC. Among the various larger and smaller dynastic seats the city of Xanthos had by far the most powerful position, only occasionally rivaled by Tlos. The political primacy of Xanthos was reflected by the leading role of its mint: Since the time of *Kuprilli* but in particular in the second half of the 5th century under *Xeriga* and *Xerẽi* the coins struck in Xanthos had set standards and often provided models for the coinages produced at other mints in the region, - at least with regard to the weight standard and the denominational system but sometimes even concerning the choice of specific motifs.

The traditional distribution of power had been temporarily disturbed by the tyranny of *Erbbina*, who had ruled the Xanthos valley primarily from his northwestern stronghold at Telmessos, but Xanthos recovered its former position soon thereafter and in the period of the diskelophoric coinage its mint had once again become the most influential production facility for coins circulating in western Lycia. A most peculiar die-link between a coin from the mint of Xanthos and one nominally coming from the mint of Pinara (Figures 79 and 93) seems to suggest that even some of the coins in the name of Pinara were in fact struck at Xanthos.

Tlos with its favourable location in the center of the Xanthos valley and its highly productive mint had evidently kept or regained much of its former importance and remained only second in rank to the city of Xanthos, but it was now rivaled in this position by the growing influence of Patara. The town was located at the southern shore near the mouth of the Xanthos river and was in possession of a good harbour. It also controlled the main road leading from Central Lycia into the Xanthos valley and had therefore a decisive strategical position. All the trade but also every invasion force from the East had to pass through this place first. Since the ultimate demise of *Erbbina* had apparently been brought about by forces of at least one dynast from Central Lycia, *Aruwātijesi*, the role played by Patara in the presumed military operations leading to the conquest of Telmessos by the latter must have been vital. Probably as a result of these events the power of Patara had risen enormously as it is reflected by the substantial output of its mint from the

---

55 See below p. 61 sqq.

56 See also Konuk 2017, but besides the fact that Konuk has failed to notice the coin from Copenhagen already published a long time ago, his attempted attribution of the issue to *Xerẽi* has no rational foundation whatsoever!

57 See Müseler 2016, p. 65 and Müseler 2017a, notes 8 and 42.
beginning of the 4th century BC onwards. However, the issues from Patara remained a separate group that differed in more than one respect from the coinages produced by the other mints in the Xanthos valley.

The images set upon several diskelophoric issues provide a number of explicit clues helping to disclose the identity of the powerful ruler, who initiated the respective coinages. One of the main series from Xanthos displays a helmeted head of Athena coupled with a youthful male head, most probably a representation of Apollon (Figures 76-80). The same combination of motifs, though executed in an earlier style, had been chosen by the elder bearer of the name Weχssere for one of his largest series (Figure 10) 58. Other motifs shown by the diskelophoric series from Xanthos like the youthful male head wearing a pileos (though without wings) can likewise be found on coins in the name of the elder Weχssere (Figures 82-83 and Figure 12), whose personal emblem had actually been the same diskeles-symbol. Not less revealing is the facing bust of Athena with the triple-crested helmet on the few diskelophoric issues from Patara (Figures 97-99). The models have rather been coins of the younger Weχssere from Zagaba (Figures 16-19) than the tetradrachm created by Eukleidas of Syracuse.

All those aspects together with the ubiquitous use of the diskeles-symbol strongly indicate that the majority of the series presented within this section was issued by someone closely related to the dynasts with the name Weχssere. Given the presumable time frame of the coinages in question this was probably no-one else than the younger Weχssere himself. Apparently this dynast had expanded the territories under his control from the mountains of Central Lycia into the Xanthos valley, possibly in connection with a military campaign against the usurper Ebbina. Following this conquest he had replaced his original emblem, the monogram on the coins issued by him in Central Lycia, with the symbol , which had been applied by his elder namesake and possible ancestor on the local coinage, – a gesture that was clearly meant to underline the legitimacy of his own rule over the former realm of the latter. The identification of the younger Weχssere as the issuer of the earlier diskelophoric coinages also provides a plausible explanation for the fact, that there is no diskeles to be found on nearly all anonymous Patarean series with the head of Hermes: The various series of this type had been introduced by Weχssere (and by Waχssepddimi, if this dynast has really to be seen as a separate person) as the initial coinage at the (re)opening of the mint. Therefore the type itself was later on connected with this ruler anyway by almost every user and the coins were not in need of any additional mark for the correct identification of their issuer.

Less clear is the role played by the issuers of the various minor coinages belonging more or less to the same period: Aruwâtijesi had been in control of the mint at Telmessos immediately following the rule of Erbina. But rather soon thereafter he had completely disappeared from western Lycia and remerged only later as the issuer of a coinage succeeding the last known series in the name of Weχssere at Zagaba. He may very well have acted as some kind of lieutenant for the more prominent ruler. The same may possibly be true for Dêñtimi, whose Tloan issue with the two seated lions is die-linked to the one with the legend Waχssepddimi and closely related to

58 The head of Athena set on the issues of the elder Weχssere (Issue I.1.9) is the first appearance of an image of this divinity in Lycian coinage altogether. It is closely copied from the Athenian tetradrachms of the same time and was most probably intended to demonstrate the political allegiance of the issuer at the beginning of the Peloponnesian war. His later defeat by Xeriga may eventually have provoked the invasion of the Athenian commander Melesandros in 428 BC: See Müseler 2016, p. 59 sqq.
Opponents and successors of the Xanthian dynasty in Western Lycia

Weχssere’s larger series of the same type showing only the diskeles in the reverse-field\(^{59}\). But it cannot be determined, whether the person addressed by the name or the term Waχssepddimi had been an independent predecessor or another deputy of Weχssere. It is even not clear, whether the word Waχssepddimi denotes a separate person at all or whether it is just another form of the name Weχssere as previously assumed by the author\(^{60}\), although the application of a separate symbol (Ϙ) on coins with this legend would rather point to a different individual behind this label. Based on the numismatic material presented here the question cannot be resolved. It will be discussed once again towards the end of this article.

The end of the diskelophoric issues of Weχssere and the passage to the respective series of Artumpara can not be clearly defined, at least as far as the coinage from Xanthos is concerned. There seem to be no coins from Telmessos that can be attributed to Weχssere, and the single diskelophoric series from Kadyanda is so closely related to a complementary issue bearing the signature of Artumpara that it can hardly be assigned to someone else. It is to be doubted that Weχssere’s sphere of influence had included the region north of Tlos for a longer period. In fact Artumpara seems to have been in control of Telmessos and the upper Xanthos valley quite early, – that is still during the reign of Weχssere in the South. His subsequent accession at Xanthos may actually have been the result of a major conflict that even involved the dynast Mithrapata from Central Lycia as well. This will be demonstrated in the following sections.

**Monetary footprints of Mithrapata in the Xanthos valley**

There is a number of differing issues from Tlos and from Patara, which seem also considerably later than the series in the names of Waχssepddimi, Ddẽntimi and Weχssere but which neither belong to the diskelophoric coinages nor to the issues signed with the name of Artumpara. The respective coinage of Patara is rather large and varied, while from Tlos only a small number of fractions is known so far. In Patara the traditional coin-types with a helmeted head of Athena combined with a bust of Hermes wearing a winged petasos, though now usually accompanied by a kerykeion and often turned to the other side, have been maintained. But at Tlos completely new types, the facing head of a young man, a murex-shell and a ketos, were introduced. On some of the Patarean coins a new linear symbol (ϗ) is set beside a figurative mark in the reverse-fields, a small dolphin or a murex-shell, which appears also as the principal type on some Tloan issues. Both, murex shell and dolphin, are known as distinctive symbols from Central Lycian coins struck at the mint of Phellos under Mithrapata and later on under Perikle (Figure 34 and Figures R-S).

The known coins from Tlos, however, do not carry any distinctive marks at all. Instead one of the small fractions is signed with the initials of the issuer: ΛΕΧ, which is beyond doubt the beginning of the name Mithrapata. All the coins presented within this section are comparatively scarce, though the overall volume of the Patarean coinage seems considerable:

The relationship between the Patarean and the Tloan group can hardly be denied. Both prove the presence of the dynast Mithrapata in the Xanthos valley, presumably at the time around the passage from the reign of Weχssere to the one of Artumpara. But the difference in size between the large and varied series from Patara and the few fractional issues from Tlos is striking. Moreover, there are once again neither any coins from Xanthos or Pinara nor are there corresponding issues from mints further to the North that can be directly associated with this coinage. Evidently Mithrapata did not succeed in seizing control of the entire Lycian West, neither in the political center of the lower Xanthos valley nor in the Northwest of the peninsula. Even his grip on Tlos does not appear to have been very firm or of long duration, since during his presence the activity of the once so important Tloan mint decreased considerably and may even have come to an end altogether. But Patara, the harbour near the mouth of the Xanthos river, where the bulk of the issues presented in this section come from, had apparently become Mithrapata’s principal stronghold in the West. The same strategical situation is reflected by the corresponding coinage of Artumpara. There is no issue in his name, which can be attributed to the mint of Patara, while a substantial coin production for him is attested at Xanthos and Telmessos as well as in Kadyanda and also in Tlos. The status of the latter mint during this time is not entirely clear, since it had struck coins in the name of both dynasts and the sequence of the respective issues cannot be established with any certainty: Artumpara might even have reconquered Tlos at a certain point, while Mithrapata seems to have kept Patara as a bridgehead over the whole period. The place has possibly remained an important vantage point for invasions from Central Lycia into the Xanthos valley apart from Tymmessos, since its harbour provided a base for naval support. The only coin of Perikle known so far that can perhaps be assigned to a mint in Western Lycia shows a facing head of Hermes wearing a winged petasos combined with the well-known frontal-portrait of the dynast on the other side (Figure T).

Enigmatic coinages from the upper course and the headwaters of the Xanthos river

Apart from the various series struck in the lower part and in the center of the valley there is a small coinage showing the name of the settlement Araxa at the upper course of the Xanthos river, which obviously belongs to the same period as the various series discussed previously, – that is to the early 4th century BC. Moreover, there is an issue from the mint at Kadyanda in the highlands between the Xanthos valley and the coastal plain of Telmessos, which has been discovered only recently and whose type forms a link to an up to now rather mysterious coin bearing the toponym of Patara. A relation to Patara is also evident on an otherwise isolated issue with the toponym of Tlos. Neither the series from Araxa nor the other coins carry any personal name. There is also no monogram or linear symbol, which could be associated with any dynast otherwise known.

61 However, for indirect connections with the various series from Araxa and a particular issue from Kadyanda see below.

62 The only symbol employed here is the monogram on issue XVII.1.3., for which no explanation is available.
Because of the strange connection between the coin from Kadyanda and a likewise unique Patarean issue the strict arrangement of the different coinages by mint is for once abolished here:

XIX.1.1. Anonymous, Stater, Tlos
Head of Athena with attic helmet to r. / Head of Hermes with winged petasos to r. in incuse circle, in field $\text{C}$, kerykeion and legend $\text{T} \wedge \text{F} \wedge$ 
SNG v. Aulock 4194 = BM 1979.0101.749* (8,15 g)
(Figure 125)

There is no precursor for the issues from Araxa among the western Lycian coinages of the 5th century BC. The series from this mint all belong to the early 4th century BC and seem to have been struck during a very limited time span. The shortlived activity of the mint may actually have been the direct result of a major military conflict in the Northwest of Lycia. Whoever was not in control...
of the important stronghold and mint in the northwestern coastal plain might have found it necessary to install a supplementary mint in the upper Xanthos-valley in order to create a logistic base independent from the harbour of Telmessos to take care of the monetary supply for his troops. This would rather point to Mithrapata, whose foothold in the center and in the northern part of the valley seems to have been rather precarious, since Artumpara, presumably his main rival, was able to threaten his position simultaneously from Xanthos in the South and Telmessos in the Northwest.

On the other hand Kadyanda had been the residence and the mint of a dynast named Hñtruma, whose reign was probably contemporaneous with the one of Ddenewele (Figures U-V)63. Later on the mint had been used by Artumpara, but apparently just for a small number of issues64. The newly discovered coin from this place (Figure 123) with its curious rendering of the toponym on both obverse and reverse but in two divergent spellings, notably differs from all the other series known from Kadyanda. But the most unusual head of Athena wearing a helmet adorned with a small running griffon corresponds to the obverse-type of another coin, which displays the same, otherwise unknown head of Athena combined with a large triskeles and the toponym of Patara on its reverse (Figure 124). No date can be established yet for those two remarkable coins, but their connection is evident. This makes their attribution to the Western coinage of Mithrapata an attractive possibility. But once again the material basis for such a hypothesis is far too narrow and we must wait for the discovery of other specimens or of related issues that may carry more information.

The unique coin of Patarean type but with the toponym of Tlos from the von Aulock collection (Figure 125) seems to be likewise the result of a typological transfer: The images clearly derive from the issues of the harbour town at the southern shore, which apparently had become the main base of Mithrapata in the West as demonstrated in the previous section. The type may simply have been “borrowed” from Patara for the first coins struck at Tlos after its conquest through Mithrapata. The types with the youthful male head en face may have been developed for the Tloan coinage of the new ruler only thereafter. But also in this case more evidence is needed.

The coinages of Artumpara

The following catalogue is indebted to Novella Vismara’s listing of the coinage attributable to Artumpara published some years ago65. However, issues that have only become known in the meantime are added and others, where the connection with the coinage of Artumpara is dubious, as well as his exile-issue from Side have been left out. Instead references to anonymous diskelophoric series that may be associated to coinages in the name of Artumpara have been inserted as well.

63 The only known hoard-context for coins of Hñtruma that allows an approximate dating is the so-called “Tissaphernes-Fund”: See Hurter 1979, p. 105, 29-30.

64 See above p. 57 referring to Issues XIV.1.1. and XX.2.1.

65 Vismara 2014.

Müseler VIII, 31* (8,11 g) (Figure 133)

Coins in the name of Artumpara seem to have been struck at Telmessos rather soon after the coinage with the monogram of Ddẽñtimi (Figure 62). The anonymous diskelophoric issue from this mint (Figure 107) with the head of Athena moved to the reverse is also with regard to its style and fabric rather in line with Xanthian and Tloan coins of Artumpara and probably represents nothing else than a somewhat later series of this dynast from Telmessos. Since the coinage of Artumpara from this place apparently comprises series of different periods, it must have been produced over quite a long time. Taken together with his (however temporary) utilization of the mint at Kadyanda this suggests that the Lycian Northwest had been the original base of Artumpara.

His accession at Xanthos and at Tlos and the beginning of the coin-production in his name at these places would have to be considered as subsequent. The adoption of the diskeloi, originally employed by Weχssere to legitimize his claim to rule in Xanthos and Tlos, through Artumpara does not necessarily point to a regular and peaceful succession; it may very well be that the latter has taken the lower Xanthos valley from his predecessor by force. Such a course of events appears to be confirmed by Artumpara’s explicit choice of models from earlier issues of the Xanthian dynast and in particular from types introduced by Xeriga after his capture of Xanthos from the elder Weχssere (Figures W-X) for his own local coinage (Figures 130 and 101). Apparently, there was an allusion to a similar political situation intended here.

One coin in the name of Artumpara (Figure 130) has made use of the same obverse-die as one belonging to the anonymous diskelophoric issues (Figure 104). This links at least the respective series with the lion-protome and the head of Athena but possibly also the ones with the head of the goddess on obverse and reverse to the Xanthian coinage of this dynast. The overall output of the mint under the rule of Artumpara must therefore be considered as substantial. The dynast seems to have defended his rule at Xanthos and at Telmessos until the very end of his reign. Only the date of his control over Tlos that was occupied by Mithrapata for some time remains an open question. However, Artumpara has evidently outlived both Weχssere and Mithrapata. He was only ousted from Western Lycia by Perikle some time around the end of the seventies67. Therefore the transition from the rule of Weχssere to the one of Artumpara and the presumed quarrels must have taken place well before that time.

In place of a conclusion

“Our selves, dismayed we stand, concerned in vain
The curtain’s drawn, all questions but remain”

Berthold Brecht, Der gute Mensch von Sezuan (1943), transl. by Tobias Schwarz

The assemblage of all the available numismatic evidence attempted here has brought to light quite a large number of details that had not been visible before and provided a more accurate view of the political circumstances and the interaction of the various agents in western Lycia between the late 5th and the early 4th century BC. However, a definite solution for a number of questions presented at the beginning of this article concerning the problem of the number of persons named Węχssere or the members of an alleged “Waχssa-Clan” is not in sight. But a few remarks may still be derived from the study of the numismatic testimonies compiled above.

Frank Kolbs most imaginative interpretation that stylizes Węχssere as a true Methusalehm among the Lycian dynasts is hardly credible. Following this reconstruction of events the man, who had issued the first series in his name still during or immediately after the final years of the reign of Kuprli in the West of Lycia, would have had disappeared thereafter for a very long time, – actually the larger part of his alleged long life. Only near the turn from the 5th to the 4th century BC the same man would have resumed to have coins struck in his name at Zagaba in Central Lycia and continued his minting activity after his presumed return to the Xanthos valley deep into the two following decades. This would make Węχssere either a mere boy at the beginning or a man of downright biblical age towards the end of his career as a money issuer68. Although not completely impossible the weakest point of this hypothesis (as already mentioned above) is its failure to explain, what happened to the dynast during the remarkably long intermission implied thereby. Moreover, it overemphasizes typological parallels but widely ignores the manifest differences between the coinages in question. From a numismatic perspective there is virtually nothing that justifies such a construction against the much more sensible interpretation of the evidence adopted hitherto, – that is the assumption of two separate individuals of the same name but belonging to two different periods. There is also no visible need created by circumstantial evidence for stretching the substance of the numismatic record this far. This hypothesis can therefore be safely discarded as a probably incorrect though amusing proposal.

But the in all respects directly opposite hypothesis brought forward by Koray Konuk and Diether Schürr is also not really conclusive, since it actually causes more problems than it tries to solve. The difficulty is not the alleged existence of homonymous agents belonging to different generations; this is in fact quite a usual phenomenon in Lycian history. But in the present case the assumption of individuals with identical names acting at two otherwise completely separate occasions thirty or even forty years apart from each other implies a nearly exact repetition of events in different historical situations. At both times we would have somebody called Węχssere playing the principal part, assisted or opposed by someone with the name Waχsseddimi and with

68 Even if an earlier dating of the “Tissaphernes stater” to the time between 411 and 407 BC as recently proposed by John O. Hyland (cfr. Hyland NN) is accepted, the underlying sequence of events remains more or less the same. If, as a consequence of Hyland’s chronological model, the tyranny of Erbbina would have to be placed rather in the last years of the 5th than in the first decade of the 4th century BC, this would only result in a difference between 5 and 10 years. In any case the impact on the supposed life-span of Frank Kolb’s Węχssere would be minimal.
the addition of a separate person called Waχssebllimi in the earlier and Uχssepddimi in the later case. This is definitely a little bit too much of a coincidence, even if we assume that all participants have belonged to one large family-clan. If this would be an account transmitted by the classical literary tradition, one would be tempted to think of an underlying narrative pattern applied by a well meaning interpreter in order to render the reported events easier comparable and thus more “exemplary” in the minds of the recipients. But we are dealing here with numismatic and epigraphic evidence, – that is with much more direct and less corruptible sources. Therefore the utmost caution is called for in the interpretation of the documents at hand, especially when these seem to suggest a duplication of historical events.

That Waχssebllimi was somebody else than the elder Weχssere seems in fact possible. He might even have been a relative of some sort as proposed by both Konuk and Schürr. But whether the Waχssepddimi mentioned on the Xanthos-Stele has really been a third person remains questionable. Also Ddẽñtimi has probably to be seen as a separate individual against the earlier proposal of the author. Like Aruwãtijesi he may have acted as a deputy for the younger Weχssere after this dynast had established himself as the superior ruler at Xanthos.

But in the cases of Weχssere, Waχssepddimi and/or Uχssepddimi the hypothesis originally brought forward by Şükrü Özüdoğru and later on endorsed by the present author with different arguments cannot be dismissed that easily: The common point of both authors was the assertion that the three appellations were just variants or composite forms of the same personal name alternately used by no-one else than the younger Weχssere in different situations. Admittedly this causes a number of difficulties from a linguistic or onomastic point of view. Moreover, it would imply that the younger Weχssere had changed his personal emblem twice in the course of his campaign and the subsequent consolidation of his rule in the West, – once from the original monogram to the linear symbol (or just a simplified form of the same monogram) and then again to the used by his supposed ancestor. But this is well possible and after all not more complicated than the assumption of a multitude of dynasts with the same or with very similar personal names either cooperating or rather jostling for supremacy in the Xanthos valley at two separate occasions. At Tlos and especially at Patara, where the issue with the name Waχssepddimi is even linked to the one with the name Weχssere through a shared obverse-die, the close relationship between the respective series is evident and the borderline between them seems floating. Before this background the idea of different name-forms referring to one and the same individual still appears the most plausible solution.

Based on the evidence presently available these problems cannot be resolved with ultimate certainty. We have to rely on the discovery of new material possibly carrying more information to answer the main question posed at the beginning of this essay. What can, however, be demonstrated is the predominant role played by the younger Weχssere as the principal issuer of

---

69 Müseler 2018 a, p. 615 has attempted to explain the name Waχssepddimi as a composition of the word wayssa- and the title pddẽnehmimĩ attested on the trilingual inscription found at the Letoon, which is translated there with the Greek term ἀρχων. As quoted by Schürr 2018, p. 98 Heiner Eichner has suggested a similar connection of the name Waχssebllimi to the word urebillaha from Kalinka, TL 11, which Schürr 2012, p. 22 considers likewise as a title.

70 After the count of Schürr 2018 not less than seven different members of this alleged clan would thus be attested.
the diskelophoric coinages in the West of Lycia at the beginning of the 4th century BC, as well as
the subsequent rivalry between Mithrapata and Artumpara until the realms of both contenders
got finally annexed by Perikle.

Opponents and successors of the Xanthian dynasty in Western Lycia: 
The Weχssere questions reconsidered

Abstract
In response to several recent studies published by Koray Konuk, Diether Schürr and Frank Kolb the author assembles the extant numismatic evidence of the early 4th century BC from Central and Western Lycia in order to reconstruct the history of the Xanthos-Valley between the end of the rule of Erbbina and the rise of Perikle and to establish the sequence of the principal political agents during that period. He is defending the traditional hypothesis that there were not less (but also not more) than two rulers with the name Weχssere. The first one had been a contemporary of Xeriga, who probably had taken the city of Xanthos from him. The second one, who might actually have been a son or a relative of his elder namesake, invaded the Xanthos-Valley from Central-Lycia bringing the reign of the tyrant Erbbina to an end at the beginning of the 4th century BC. While the likewise attested agents Aruwãtijesi and Ddẽñtimi were probably co-rulers or lieutenants, the author holds that Waχssebllimi, Waχssepddimi and Uχssepddimi are possibly to be seen as nothing else than composite name-forms used by the elder and the younger Weχssere respectively. Furthermore, the author comes to the conclusion that the numismatic material might point to a conflict between Mithrapata and Artumpara in Western Lycia before both were finally defea-ted by Perikle.

Keywords: Lycia, dynamic coinage, sequence of rulership, Weχssere, Xanthos.
