1967 Güneş Leke Rasatları

The Sunspot Observations Made in 1967

by Salih Karaali

(İstanbul University Observatory)

Özet: İstanbul Üniversitesi Observatuvarında yapılan fotosferik rasatlarda güneşin göründüğü bir projeksiyon diskü üzerinde düşürülmektedir ve yüzeyinde görülebilen lekeler ile meşalelerin resmi çizilmektedir. Bu resimlere dayanarak leke gruplarının helyografal koordinatları her gün için tayin edilir.

Makalede, 1967 yılında yapılan rasatlarda, rasat şemaları yardımcı ile leke gruplarının koordinatları tayin edilmiş ve bunlara ait bazı istatistikel bilgi hazırlanıp sonuçlar cetvel halinde verilmiştir.

* * *

Summary : In the photospheric observations made at the İstanbul University Observatory, observable sunspots and faculae are drawn on a projected disk of the sun and the heliographic coordinates of the sunspots are determined from this drawings.

This paper gives the heliographic coordinates for the sunspot groups observed in 1967 and some other statistical results.

* * *

The photosphere of the sun is observed on every clear day at the İstanbul University Observatory. A refracting telescope is used for this purpose ; the aperture of the objective and the focal length are 13 cm. and 200 cm. respectively. Sunspots and faculae are drawn on a projection disk of a diameter of 25 cm. The heliographic coordinates of the sunspot groups are determined from the American Ephemeris and Nautical Almanac. Each sunspot group is observed for a single rotation of the sun and the results obtained during this period are given in tables and in figures.

In this paper, columns in Table 1 give the following : (1) Current numbers of the groups ; (2) and (3) : The latitudes and longitudes of the groups respectively, which are the average of the latitudes and longitudes measured each day ;

(4) and (5) : First and the last observations of the groups respectively ; (6) : Evolution of the groups which are classified according to the standard classification of Zurich. The letters characterize the types of the groups and the numbers after them give the number of umbrae in each group. The sign " ? " denotes a group which was observed at the edge of the disk and so could not be identified in the Zurich classification. The sign (*) is used to express that the group probably could not be observed on that day, and (—) that no observation was made on that day because of weather conditions or other reasons.

In 1967, 625 groups were observed ; 393 of them in the North Hemisphere with an average latitude of $+19^{\circ}3$ and remained 232 groups in the South Hemisphere with an average latitude of $-20^{\circ}9$. The distribution of the groups according to their latitudes is as follows (see Fig. 1) :

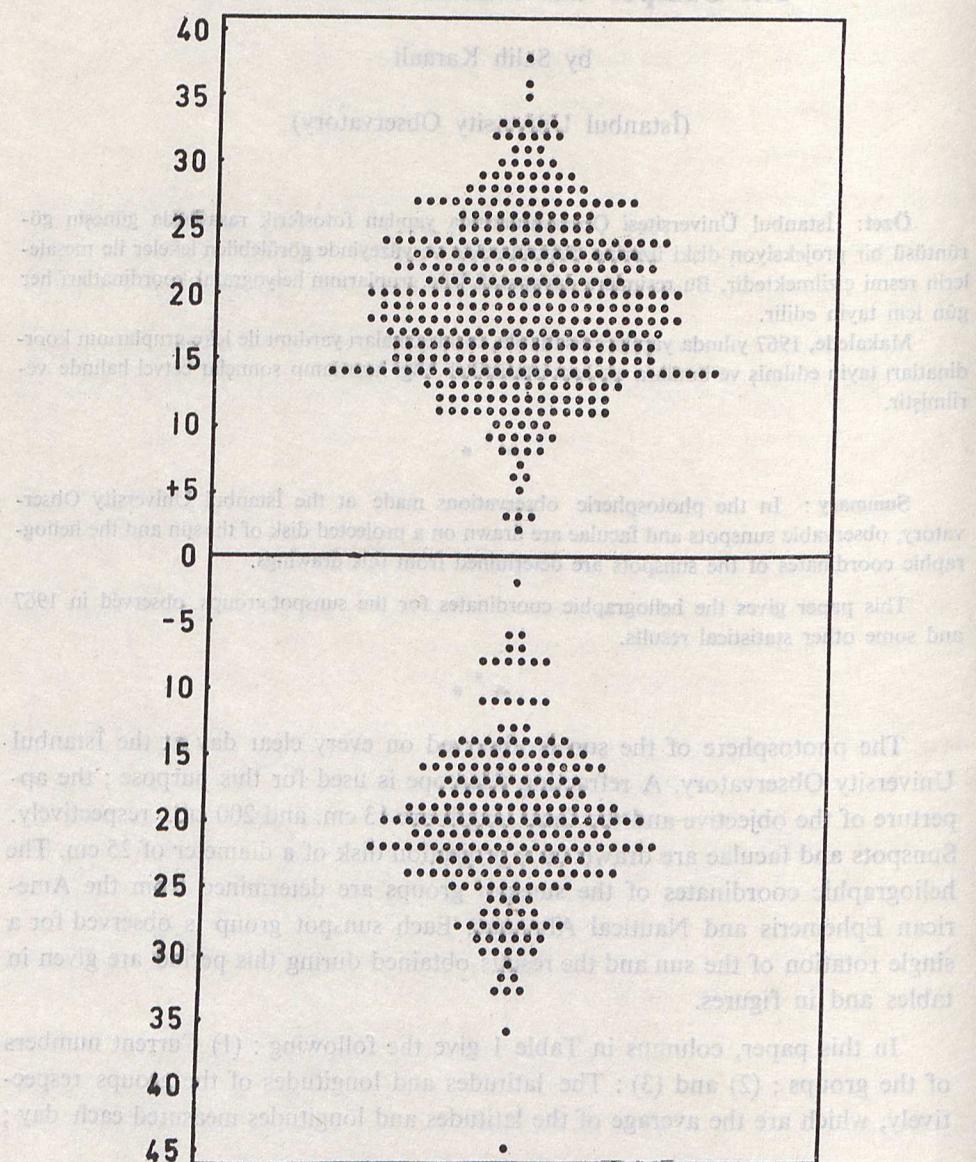

Fig. 1

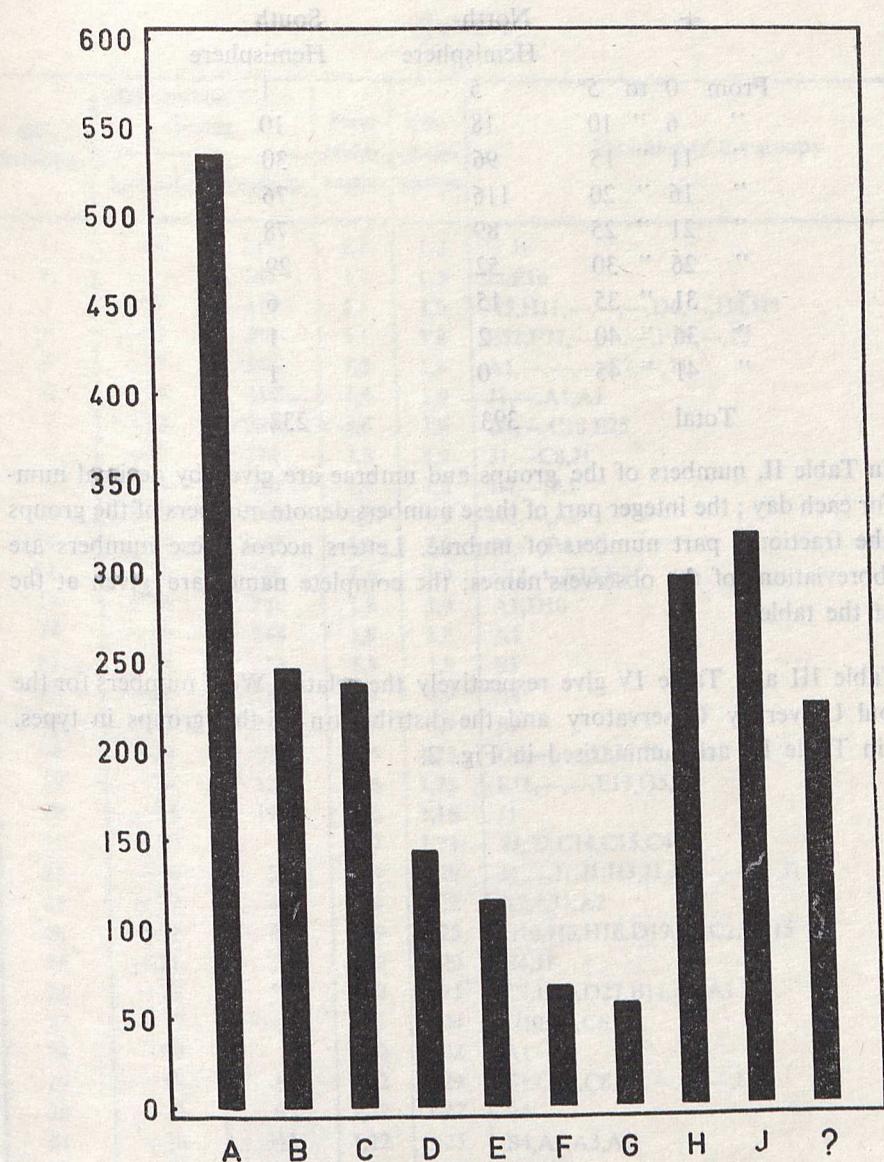

Fig. 2

THE SUNSPOT OBSERVATIONS MADE IN 1967

| \pm | | North Hemisphere | South Hemisphere |
|-------|------------------------|------------------|------------------|
| From | 0° to 5° | 5 | 1 |
| " | 6 " 10 | 18 | 10 |
| " | 11 " 15 | 96 | 30 |
| " | 16 " 20 | 116 | 76 |
| " | 21 " 25 | 89 | 78 |
| " | 26 " 30 | 52 | 29 |
| " | 31 " 35 | 15 | 6 |
| " | 36 " 40 | 2 | 1 |
| " | 41 " 45 | 0 | 1 |
| Total | | 393 | 232 |

In Table II, numbers of the groups and umbrae are given by decimal numbers for each day ; the integer part of these numbers denote numbers of the groups and the fractional part numbers of umbrae. Letters accros these numbers are the abbreviations of the observers' names; the complete names are given at the end of the table.

Table III and Table IV give respectively the relative Wolf numbers for the Istanbul University Observatory and the distribution of the groups in types. Date in Table IV are summarised in Fig. 2.
