Abstract

One specimen of *B. svetovidovi* (SL: 326 mm, TL: 349 mm) was captured by net off Samandağı (Hatay) on 29 April 2004. *L. dieuzeidei* (SL: 102 mm, TL: 126 mm) was obtained by bottom trawl haul on 24 April 2004 at a depth of 77 m in İskenderun Bay. Thus, *B. svetovidovi* and *L. dieuzeidei* reported in this study is believed to be a new record for Turkish coast of the Eastern Mediterranean.

Keywords: *Belone svetovidovi*, *Lepidotrigla dieuzeidei*, Eastern Mediterranean Turkish waters.

Introduction

In the Mediterranean Basin, the Garfish *Belone svetovidovi* Collette and Parin, 1970 is known from the southern north-eastern Atlantic (Collette and Parin, 1986 and Fischer *et al.* 1987), from the eastern Mediterranean, Israel (Golani, 1996) and from the Aegean Sea (Meriç and Altun, 1999).

Lepidotrigla dieuzeidei Audoin in Blanc and Hureau, 1973 has been reported so far from Greek waters of the north Aegean Sea (Fischer *et al.* 1987), from Greek territorial waters of the Aegean Sea (Papaconstantinou, 1988), from the eastern Mediterranean, Israel (Golani, 1996), from Turkish territorial waters of the Aegean Sea (Bilecenoğlu *et al.* 2002), and from the Sea of Marmara (Eryılmaz, 2002).

Materials and Methods

One specimen of *B. svetovidovi* (SL: 326 mm, TL: 349 mm) was captured by net off Samandağı (Hatay) on 29 April 2004. *L. dieuzeidei* (SL: 102 mm, TL: 126 mm) was obtained by bottom trawl haul on 24 April 2004, ($36^{\circ}25'53''$ - $36^{\circ}28'59''$ N, $35^{\circ}38'90''$ - $35^{\circ}48'14''$ E) at a depth of 77 m in Iskenderun Bay. The specimens were fixed and stored in 5% formaline solution. Samples (Fig.1, 2) have been conserved in the Hydrobiological Museum of the Department of Biology, Faculty of Science, Istanbul University, catalog no. 8500-668 and 10650-669 respectively.

Figure 1. *Belone svetovidovi* (TL 349 mm), Cat. no. 8500-668.

Figure 2. *Lepidotrigla dieuzeidei* (TL 126 mm), Cat.no.10650-669.

Results and Discussion

Description: *B. svetovidovi* has a body with more compressed and narrower inter-orbital width. The most obvious differences between *B. belone* and *B. svetovidovi* are the size and density of the beak teeth: *B. svetovidovi* is characterized by its smaller, more delicate and featured 14 teeth within a section of the middle of the upper jaw equaling the diameter of its eye; teeth present on vomer; eye diameter 9 mm; snout length, total length ratio 16.6 %. Dorsal finrays 17, anal finrays 22, pectoral finrays 13, total gill rakers on first gill arch 41. *L. dieuzeidei* greatly resembles *L. cavillone*, differing in that the occipital groove behind the eyes is not deeply marked and has no spines; no spines in front of eyes; preorbital bones with several spines nearly equal in size; cleitral spine length, standard length ratio 9.8 %; teeth present on vomer. First dorsal fin IX spines, second dorsal and anal fins with 14 rays; longest free ray of pectoral fin, reaching anus; total gill rakers on first gill arch 9. *B. svetovidovi* and *L. dieuzeidei* reported in this study is believed to be a new record for Turkish coast of the Eastern Mediterranean.

Özet

Samandağı (Hatay) açıklarında, 29 Nisan 2004 tarihinde ağ ile bir adet *Belone svetovidovi* (Zargana balığı) (SL: 326 mm, TL: 349 mm); İskenderun Körfezi’nde 24 Nisan 2004 tarihinde yapılan trol çalışmaları sonucunda 77 m derinlikten bir adet *Lepidotrigla dieuzeidei* (SL: 102 mm, TL: 126 mm) yakalanmıştır. Böylece *B. Svetovidovi* ve *L. dieuzeidei* Doğu Akdeniz'in Türkiye suları için, bu çalışmada yeni kayıt olarak bildirilmiştir.

Acknowledgement

We thank Cabir Dalyan and Semir Demir for providing the specimens.
