Abstract

In this study, marine algae and sea grasses in the upper infralittoral zone of the Black Sea coast of Giresun (Black Sea, Turkey) have been examined. Totally 193 taxa have been determined. 18 of them belong to blue-green bacteria (*Cyanobacteria*), 109 to red algae (*Rhodophyta*), 33 to brown algae (*Ochrophyta*), 30 to green algae (*Chlorophyta*) and 3 to sea grasses (*Magnoliophyta*). *Erythrotrichia investiens*, *E. vexillaris*, *Lophosiphonia scopulorum* and *Spermothamnion repens* var. *flagelliferum* are new records for Turkish shores of the Black Sea.

Key Words: algae, seagrasses, Giresun, Black Sea, Turkey

Introduction

According to Zinova (1964), the earliest study on Turkish algae was performed by Buxbaum (1740), Tchichatcheff (1860), Sperk (1869) and Zernow (1913). Additionally, Agardh (1822-1823, 1828), Fritsch (1899), Dratzuyan (1894-1895), Woronichin (1908a, b), Stockmayer (1909), Güven (1970), Zeybek (1973), Cirik and Cihangir (1987), Altındağ (1987), Öztürk (1988), Aysel and Erduğan (1995), Aysel *et al.* (1990, 1996, 1997, 1998, 2000, 2004, 2005 (in press), Özer and Köksal (1993), Erduğan *et al.* (1996, 2003), have also carried out floristic studies on Black sea coasts of Turkey

* Corresponding author: vaysel@comu.edu.tr

Material and Method

Collected specimens were fixed using 4 % formaldehyde for long term preservation. Specimens belonging to *Rhodomelaceae* and *Corallinaceae* were exceptionally treated with 10 % HCl because of their specific cell wall properties in identification procedures.

Classes were arranged according to different authors [*Rhodophyceae* (Benhissoune *et al.*, 2002b), *Fucophyceae* (Ribera *et al.*, 1992, Benhissoune *et al.*, 2002a), *Chlorophyceae* (Gallardo *et al.*, 1993, Benhissoune *et al.*, 2001)]. Arrangement of lower categories (order and families) presented in the list were followed by specialists [*Corallinales* (Bressan and Babbini-Benussi 1995, 1996), *Gracilariales* (Frederic and Hommersand, 1989), *Ceramiales* (Gomez Garreta *et al.*, 2001, Benhissoune *et al.*, 2003), *Acrochaetiaceae* (Stegenga, 1985)]. Additionally, the studies of Silva *et al.* (1996), Van den Hoek *et al.* (1997), Barbara and Cremades (1996), Ballantine and Aponte (1997), Hardy and Guiry (2003) and Guiry and Dhonncha (2005) were used to create an evolutionary list of taxa in genus level. Taxa in specific or infraspecific level are listed in alphabetical order.

Results

Giresun is situated between $38^{\circ} 06' 12''$ and $39^{\circ} 09' 38''$ East longitudes (Figure 1). The majority parts of the sea shore is observed to be sandy and tin pebbly beach which do not form the conditions that algae need to develop. On the other hand, some samples have been collected from the study areas: Piraziz, Bulancak, Keşap, Espiye, Gülburnu, Tirebolu, Görele and Eynesil where rocky areas exist and shelters are located.

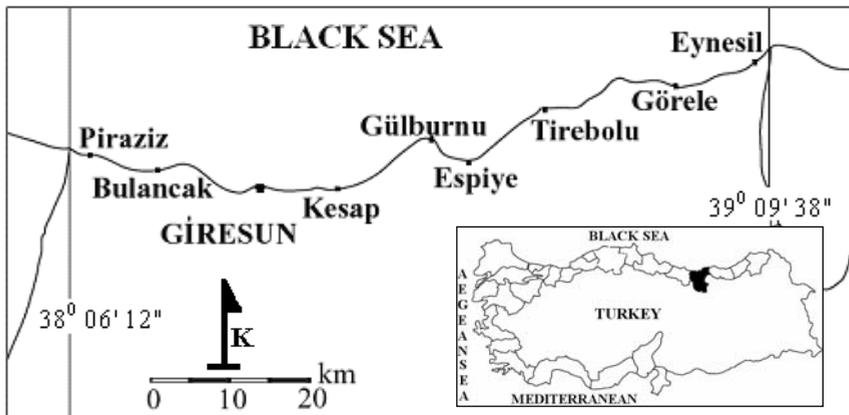

Figure 1: Map of the studied shores

Taxa distributed in study area are listed in table 1. New records for the Turkish shores of the Black Sea are indicated an asteriks (*).

Discussion

In this study, 193 taxa to Magnoliophyta (3), Chlorophyta (30), Ochrophyta (33), *Rhodophyta* (109) and *Cyanophyta* (18) have been found. Although similar Algal composition is observed on different parts of the Black Sea coastal line, the density of the algae is distinctive at each station. Different types of algae such as *Ulva*, *Enteromorpha*, *Callithamnion*, *Ceramium* and *Polysiphonia* are also observed at these stations. The coast line of Bulancak on which there was no *Cystoseira* is monitored, is observed to be polluted. The station around the light house at Espiye is the richest algae area which attracts attention with its clean water. *Padina*, *Zanardinia*, *Cystoseira*, *Ceramium*, *Polysiphonia*, *Laurencia*, *Gelidium* and *Dictyota* formed a massive density of vegetation which can be described as a sea forest in this area. Generally, *Cladophora*, *Ulva*, *Corallina* and *Cystoseira* are dominating species at tiny bays which fisherman use as shelters and small harbours.

Due to the sea water temperature and salinity, some other algae which can easily survive at different coastal line of Turkey, are not observed at these stations. In contrast, fresh water taxa forms of (*Cladophora glomerata* var. *glomerata*, *Enteromorpha prolifera* subsp. *prolifera*) are found at these stations.

Table 2: A comparison, in terms of number of algae species between Giresun and remaining provinces of the region (KR: Kırklareli, KSD: Kocaeli, Sakarya, Düzce, ZN: Zonguldak, BR: Bartın, KS: Kastamonu, SN: Sinop, SM: Samsun OR: Ordu, TR: Trabzon, RA: Rize-Artvin).

<i>Ochrophyta</i> (O)	24	50	42	43	56	52	27	27	33	8	15
<i>Chlorophyta</i> (C)	30	46	43	39	48	55	22	26	30	23	27
<i>Magnoliophyta</i>	3	3	3	3	3	3	3	4	3	3	3
Total	151	255	208	213	262	268	178	164	193	58	91

A comparison in terms of number of algae species between Giresun and remaining provinces of the region is listed in Table 2 and rates of dominance is given in table 3.

R/C and R/O rates at Giresun coast, such as other provinces of the Black Sea of Turkey, are also higher than Aegean and Mediterranean coasts. The close results of the study in terms of O/CY and C/CY rates points the attention paid on to blue-green bacterias.

The numbers of taxa periodically increases from west to east until Sinop (Table 2). The number then decreases in Samsun, but increases again in Giresun, which is the following station. According to Güner and Aysel (1996), this can be the result of the interior currents of Black Sea.

The strong current of Mediterranean carries the algae spores through the Aegean Sea, Dardanelles, the Marmara Sea and Bosphorus to the Black Sea. This current changes its direction towards the Azak Sea. A following current from Azak Sea to Ukraine, Rumania, Bulgaria, Thrace (Turkey) is combined to another one coming through Bosphorus. All these currents help the circulation of algae and stand as a major factor for the attendance of algae at the Black Sea. Smaller circulated flows at the east of Sinop play an important role for the marine algal flora. These smaller flows get back to Sinop after completing their circle from Caucasia Eastern Azak Sea. In addition, these smaller flows play a limited role in algal variety of the region. This issue is also observed at the decreasing numbers of taxa numbers from west to east.

Biological diversity of the Black Sea coast has decreased in recent years due to on going high way construction following the coastal line. As a result of the increasing pollution and worse environmental factors effects, Giresun must be declared as sit area as soon as possible such as the rest of all the Black Sea coastal line, to protect its biological variety.

Finally, owing human and/or industrial sourced pollution and the geographic structure of the Black Sea flora, is badly affected. The filling up of the coast to build up a road all the way along the Black Sea also has an additional negative effect on the sea flora. Therefore, economical

species which are valuable for Turkey and other countries are facing the danger of disappearance.

Table 3: Dominancy in division level among northeastern provinces of Turkey

Division	Dominancy as cities in division level from the Black Sea Shores of Turkey										
	GR	KR	KSD	ZN	BR	SN	KS	SM	OR	TR	RA
R/O	3,30	3	2,52	2,4	2,7	2,60	2,37	3,92	3,44	2,9	2,9
R/C	3,63	3,7	2,73	2,3	3	2,50	2,77	4,81	3,58	1	1,6
R/CY	6,05	3,1	4,2	5	9,7	6,50	6,04	4,3	6,64	23	14,3
O/C	1,1	0,8	1,08	1	1,1	0,96	1,16	1,22	1,04	0,3	0,6
O/CY	1,83	1	1,66	2,1	3,6	2,50	2,54	1,35	1,93	8	5
C/CY	1,66	1,3	1,53	2,2	3,3	2,59	2,18	1,1	1,86	23	9

As seen in table 3, blue-green bacteria are becoming rare at Rize and Artvin provinces. We believe these two provinces should be revived in terms of general algal flora.

Özet

Bu araştırmada, Giresun (Karadeniz, Türkiye) sahillerinin üst infralittoralinde yayılış gösteren deniz algleri ve deniz çayırları çalışılmıştır. Mavi-yeşil bakterilerden (*Cyanophyta*) 18, kırmızı alglerden (*Rhodophyta*) 109, kahverengi alglerden (*Ochrophyta*) 33, yeşil alglerden (*Chlorophyta*) 30 ve deniz çayırlarından (*Magnoliophyta*) 3 olmak üzere toplam 193 takson tayin edilmiştir. *Erythrotrichia investiens*, *E. vexillaris*, *Lophosiphonia scopulorum* ve *Spermothamnion repens* var. *flagelliferum* Türkiye Karadeniz kıyıları için yeni kayıttır.

Marine Algae and Seagrasses of Antalya Shore

(Mediterranean, Turkey)

Antalya Kıyılarındaki Deniz Algleri ve Deniz Çayırları

E. Ş. OKUDAN, V. AYSEL

Çanakkale Onsekiz Mart University, Faculty of Science and Arts, Biology Department, Çanakkale, Turkey

Abstract

In this study, the upper infralittoral zone of Antalya (Turkish Mediterranean coasts) was researched. 375 algae and five seagrasses were determined. There are (36 taxon) blue-green algae (*Cyanophyceae*), (198 taxon) red algae [*Rhodellophyceae* (1), *Compsopogonophyceae* (2), *Bangiophyceae* (5), *Florideophyceae* (190)], (74 taxon) brown algae (*Fucophyceae*), (67 taxon) green algae [*Chlorophyceae* (4), *Ulvophyceae* (18), *Cladophorophyceae* (23), *Bryopsidophyceae* (20), *Dasycladophyceae*(2)] and (5 taxon) seagrasses (*Liliopsida*). *Bonnemaisonia clavata* G. Hamel (*Rhodophyceae*) was given as new record for the Turkish Marines. *Leibleinia epiphytica* (Hieronymus) Anagnostidis & Komárek, *Microchaete grisea* Thuret, *Calothrix scopulorum* (Weber van Bosse & Mohr) C. Agardh (*Cyanophyceae*), *Gelidiocolax christinae* J. Feldman et G. Feldman, *Falkenbergia hildenbrandii* (Bornet) Falkenberg, *Hydrolithon farinosum* var. *chalicodictyum* (W.R. Taylor) Serio, *Acrodiscus vidovichii* (Meneghini) Zanardini, *Ceramium codii* (Richards) Feldmann Mazoyer, *Chondria mairei* Feldmann Mazoyer, *Polysiphonia paniculata* Montagne (*Rhodophyceae*) and *Ulva curvata* (Kützting) De Toni (*Ulvophyceae*) were given as new record for the Turkish coasts of Mediterranean.

Key Words: Blue-green algae, red algae, brown algae, green algae, seagrasses, Antalya, Mediterranean, Turkey. * e-mail: eyalinsu@yahoo.com

Introduction

The first investigations of the Turkish Mediterranean algae were carried out by Öztüğ (1957). Followed by the contribution from Karamanoğlu (1964), Additionally Apaydın *et al.* (2002) published a new record for The Algal Flora of Turkey: *Chaetomorpha crassa* (C. Agardh) Kützing (Cladophoraceae, Chlorophyceae). Aysel and Gezerler-Şıpal (1996) published the check liste of *Cyanophyceae*, *Chlorophyceae*, *Charophyceae* and *Angiospermae* of Turkish Mediterranean coasts. Aysel (1997a, b) studied the check liste of *Rhodophyta*, *Fucophyceae* and *Phaeophyceae* of Turkish Mediterranean coasts. Patara- Kalkan was investigated by Aysel *et al.* (1998). Aysel *et al.* (2002) published a new record for The Algal Flora of Turkey: *Caulerpa scalpelliformis* (R. Brown ex Turner) C. Agardh var. *denticulata* (Dacaisne) Weber van Bosse (*Caulerpanceae*, *Caulerpales*). Muğla was investigated Aysel *et al.* (2003). Aysel *et al.* (2005a,b,c) studied on distribution of marine macro algae on Adana, Hatay and Mersin shores. Cirik studied distribution of marine algae on Akkuyu costs in 1986 and 1991. Cirik & Öztürk (1991) published about *Caulerpa racemosa* that distribution on Turkish Mediterranean coast. Ertan *et al.* published a new record for The Algal Flora of Turkey; *Caulerpa scalpelliformis* (Brown ex Turner C. Agardh (*Caluerpaceae*, *Chlorophyceae*) in 1998. Everset *et al.* (1997) invastigated macroscopic marine algae from İskenderun Bay. Öztürk investigated distribution of *Cutleriales*, *Sphacelariales*, *Scytosiphonales*, *Dictyotales* (1988), and *Chordariales*, *Sporochnales* (1993), *Fucales* (1996a) and *Punctariales* (1996b) on Aegean Sea and Turkish Mediterranean coast. Öztürk and Güner (1986) studied on *Ectocarpales* (*Phaeophyta*) on Aegean Sea and Turkish Mediterranean coast., Taşkın *et al.* (2000a,b) investigated distribution of *Rhodophyta*, *Cyanophyceae* and *Chlorophyceae* on İskenderun gulf (Hatay coast). Taşkın *et al.* (2001) published three new record for The Algal Flora of Turkey. Turna *et al.* (2000a) were published a new record for The Algal Flora of Turkey; *Botryocladia madagascariensis* G. Feldmann (*Rhodymeniaceae*, *Rhodophyceae*). Turna *et al.* (2000b) studied on distribution of *Chlorophyta* on Antalya bay. Turna *et al.* (2002) studied on seasonal Variations in the Biomass of Macro-Algal Communities from the

Gulf of Antalya. Turna *et al.* (2003) investigated distribution of Brown algae and Red algae on Antalya bay (Mediterranean). Yağcı & Turna (2002) published a new record for The Algal Flora of Turkey; *Chaetomorpha crassa* (C.Agardh) Kützing (*Cladophoraceae*, *Chlorophyceae*).

Material and Methods

Collected specimens were fixed using 4 % formaldehyde. Specimens belonging to *Rhodomelaceae* and *Corallinaceae* were exceptionally treated with 10 % HCl in identification procedures for specific cell wall properties. Antalya is situated between 29° 16' 23" and 32° 33' 42" eastern longitudes (Figure 1).

Figure 1: Map of Antalya coastline

The distribution of algae on the Turkish marin that new recorded for the Turkish coasts of Mediterranean is given in Figure 3 [Artvin (1), Rize (2), Trabzon (3), Giresun (4), Ordu (5), Samsun (6), Sinop (7), Kastamonu (8), Bartın (9), Zonguldak (10), Düzce (11), Sakarya (12), Kocaeli (13), İstanbul (14), Kırklareli (15), Tekirdağ (16), Edirne (17), Çanakkale (18), Balıkesir (19), Bursa (20), Yalova (21), Gökçeada (22), Bozcaada (23), İzmir (24), Aydın (25), Muğla (26), Antalya (27), Mersin (28), Adana (29), Hatay (30)].

Results

Taxa distributed in study area are listed in Table 1. In this list, classes and upper categories were arranged according to Van den Hoek *et al.* (1997) and Guiry and Dhooncha (2005). Arrangement of lower categories, presented in the list were followed by specialists [(Silva *et al.* (1996) for *Cyanophyta* and *Rhodophyta*, Stegenga (1985) for *Acrochaetiales*, Frederic and Hommersand (1989) for *Gracilariales*, Bressan and Babbini-Benussi (1995, 1996) for *Corallinales*, Gomez Garreta *et al.* (2001) for *Ceramiales*, Ribera *et al.* (1992) for *Fucophyceae*, Gallardo *et al.* (1993) for *Chlorophyceae*]. Additionally, the studies of Barbara and Cremades (1996), Ballantine and Aponte (1997) and Hardy and Guiry (2003) were used to create an evolutionary list of taxa above genus level. Taxa in species or below species level are listed alphabetically. New records for the Turkish Marines (**) and the Turkish coasts of Mediterranean (*) are indicated with asteriks.

Table 1: Taxa distributed on Antalya (Mediterranean) coasts of Turkey. (**): Türkish marines, (*): Turkish coasts of Mediterranean.

Discussion

380 taxa (375 algae and 5 seagrasses) have been found in the present study. One of them [*Bonnemaisonia clavata* G. Hamel (*Rhodophyceae*)] is new record for the Turkish Marines (Figure 2). 11 of them [*Leibleinia epiphytica* (Hieronymus) Anagnostidis & Komárek, *Microchaete grisea* Thuret, *Calothrix scopulorum* (Weber van Bosse & Mohr) C. Agardh (*Cyanophyceae*), *Gelidiocolax christinae* J. Feldman et G. Feldman, *Falkenbergia hildenbrandii* (Bornet) Falkenberg, *Hydrolithon farinosum* var. *chalicodictyum* (W.R. Taylor) Serio, *Acrodiscus vidovichii* (Meneghini) Zanardini, *Ceramium codii* (Richards) Feldmann Mazoyer, *Chondria mairei* Feldmann Mazoyer, *Polysiphonia paniculata* Montagne

(*Rhodophyceae*) and *Ulva curvata* (Kützinger) De Toni (*Ulvophyceae*) are new record for the Turkish coasts of Mediterranean. Their distribution of Turkish marines are seen Figure 3. As seen in Table 2, the comparison of the number of algal species of Antalya with those of the other Mediterranean coastal cities of Turkey was given. Species richness of *Cyanophyta* is relatively lower in provinces such as Muğla, Antalya, Mersin, Adana and Hatay. But Mersin, Adana and Hatay is having very poor a position too.

Phycologically, Antalya compared with the other cities of Mediterranean, is one of the richest provinces of southern Turkey.

Table 2: The number of algae species of Antalya and the other the Mediterranean coastal cities (AN: Antalya, AN*: (Aysel *et al.*, 1996, 1998, Aysel 1997a-b, Turna *et al* 2000a-b, 2002, 2003) MU: Muğla, MR: Mersin, AD: Adana, HT: Hatay).

Division	Studied Cities of Turkish Mediterranean Shores					
	AN	AN*	MU	MR	AD	HT
<i>Cyanophyta</i> (Cy)	36	31	40	36	27	30
<i>Rhodophyta</i> (R)	198	163	222	204	204	201
<i>Ochrophyta</i> (O)	74	71	99	82	78	73
<i>Chlorophyta</i> (C)	67	61	73	74	72	73
<i>Magnoliophyta</i>	5	5	5	5	5	5
Total	380	331	439	401	386	382

Species of *Cystoseira*, *Zanardinia* and *Dictyotaceae* are the most encountered algae along Antalya shore. *Corallina mediterranea*, *Callithamnion corymbosum*, *Ceramium siliquosum* var. *siliquosum*, *Herposiphonia secunda* f. *secunda*, *Laurencia obtusa* var. *obtusa*, *Polysiphonia sertularioides* (*Rhodophyceae*), *Ectocarpus siliculosus* var. *siliculosus*, *Feldmannia irregularis* (*Fucophyceae*), *Enteromorpha linza* var. *linza*, *E. prolifera* subsp. *prolifera*, *Ulva rigida* f. *rigida* and *Cladophora albida* (*Chlorophyta*) are common algae of the area.

As seen in Table 3, number of *Cyanophyta* species is low in Mersin, Adana and Hatay provinces. These divisions were not sufficiently investigated in these cities. Because, especially Adana and Hatay

shore are in the İskenderun Bay. This bay has been polluted by domestic or industrial pollution.

While common taxa of the seagrasses *Posidonia*, *Zostera* and *Cymodocea* are also found in Antalya shores, some algae, such as taxa of *Polysiphonia*, *Ceramium*, *Ectocarpus*, *Enteromorpha* and *Cladophora* are common. The most of this genus are found as epiphytic forms on the marine phenerogams and the other different macro algae (*Cystoseira*, *Cladostephus*, *Hypnea*, *Ulva*, *Cladophora*, *Codium* etc.).

Table 3: Dominancy in division level among southern provinces of Turkey

Division	Dominancy as cities in division level from the mediterranean shores of Turkey					
	AN	AN*	MU	MR	AD	HT
R/O	2,675	2.295	2.242	2.487	2.615	2.753
R/C	2,955	2.672	3.041	2.756	2.833	2.753
R/CY	5,500	5.258	5.550	5.666	7.555	6.700
O/C	1,104	1.163	1.356	1.108	1.083	1
O/CY	2,055	2.290	2.475	2.277	2.888	2.433
C/CY	1,861	1.967	1.825	2.055	2.666	2.433

Dominancy of taxa depending upon on provinces is summarized in Table 3. In this table, R/O values are relatively close among all provinces and changes between 2,242 and 2,753. According to these data, it can be stated out that Mediterranean shores of Turkey is not polluted heavily.

Figure 2. New records for the algal flora of Turkey (*Bonnemaisonia clavata* G. Hamel).

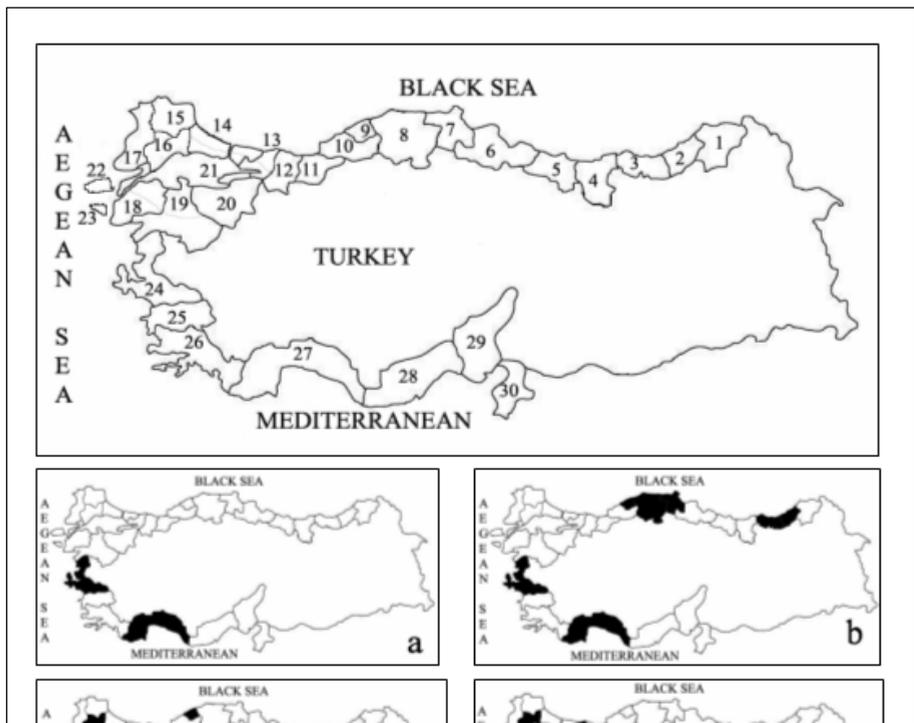

Figure 3. Distribution of algae on the Türkish marin that new recorded for the Turkish coasts of Mediterranean. *Leibleinia epiphytica* (Hieronymus) Anagnostidis & Komárek (a), *Microchaete grisea* Thuret (a), *Calothrix scopulorum* (Weber van Bosse & Mohr) C. Agardh (f), *Gelidiocolax christinae* J. Feldman et G. Feldman (h), *Falkenbergia hildenbrandii* (Bornet) Falkenberg (d), *Hydrolithon farinosum* var. *chalicodictyum* (W.R. Taylor) Serio (a), *Acrodiscus vidovichii* (Meneghini) Zanardini (a), *Ceramium codii* (Richards) Feldmann Mazoyer (g), *Chondria mairei* Feldmann Mazoyer (e), *Polysiphonia paniculata* Montagne (b), *Ulva curvata* (Kützing) De Toni (c)

Özet

Bu çalışmada Antalya'nın (Türkiye'nin akdeniz kıyıları) üst infralittoral zonu çalışılmıştır. 375 alg ve beş deniz çayırı tayin edilmiştir. Bunlar Mavi-yeşil bakteriler (36 takson) (*Cyanophyceae*), kırmızı algler (198 takson) [*Rhodellophyceae* (1), *Compsopogonophyceae* (2), *Bangiophyceae* (5), *Florideophyceae* (190)], kahverengi algler (74 takson) (*Fucophyceae*), yeşil algler (67 takson) [*Chlorophyceae* (4), *Ulvophyceae* (18), *Cladophorophyceae* (23), *Bryopsidophyceae* (20), *Dasycladophyceae*(2)] ve çiçekli bitkilerdir (5 takson) (*Liliopsida*). Bunlardan ***Bonnemaisonia clavata*** G. Hamel Türkiye denizleri için yeni kayıt olarak verilirken, ***Leibleinia epiphytica*** (Hieronymus) Anagnostidis & Komárek, ***Microchaete grisea*** Thuret, ***Calothrix scopulorum*** (Webervan Bosse & Mohr) C. Agardh, ***Gelidiocolax christinae*** J. Feldman et G. Feldman, ***Falkenbergia hildenbrandii*** (Bornet) Falkenberg, ***Hydrolithon farinosum*** var. ***chalicodictyum*** (W.R. Taylor) Serio, ***Acrodiscus vidovichii*** (Meneghini) Zanardini, ***Ceramium codii*** (Richards) Feldmann Mazoyer, ***Chondria mairei*** Feldmann Mazoyer, ***Polysiphonia paniculata*** Montagne ve ***Ulva curvata*** (Kützinger) De Toni Türkiye Akdeniz Kıyıları için yeni kayıt olarak verilmişlerdir.

Marine Algae and Seagrasses of Mersin Shore

(Mediterranean, Turkey)

Mersin Kıyılarının Deniz Algeri ve Deniz Çayıruları

*V. AYSEL, E. Ş. OKUDAN, ERDUĞAN, H.

Çanakkale Onsekiz Mart University, Faculty of Science and Arts, Biology Department, Çanakkale, Turkey

Abstract

In this research, marine algae and seagrasses were investigated in the upper infralittoral zone of Mersin (Turkish Mediterranean coasts). A total of 396 algae and 5 seagrasses were determined. 36 of them belong to blue-green algae (*Cyanophyceae*), 204 to red algae [*Rhodellophyceae* (2), *Compsopogonophyceae* (2), *Bangiophyceae* (6), *Florideophyceae*(194)], 82 to brown algae (*Fucophyceae*), 74 to green algae [*Chlorophyceae* (7), *Ulvophyceae* (19), *Trentepohliophyceae* (1), *Cladophorophyceae* (25), *Bryopsidophyceae* (20), *Dasycladophyceae* (2)] and 5 to seagrasses (*Liliopsida*).

Key Words: Blue-green algae, red algae, brown algae, green algae, seagrasses, Mersin, Mediterranean, Turkey.

Introduction

The earliest study on Turkish Mediterranean algae was performed by Öztığ (1957), Karamanođlu (1964), Additionally Apaydın *et al.* (2002), Aysel (1997a, b), Aysel & Gezerler- Şıpal (1996), Aysel *et*

al. (1998, 2002, 2003, 2005a,b), Cirik (1986, 1991), Cirik & Öztürk (1991), Ertan *et al.* (1998), Everest *et al.* (1997), Okudan & Aysel (2005), Öztürk (1988, 1993, 1996a, b), Öztürk & Güner (1986), Taşkın *et al.* (2000a,b 2001), Turna *et al.* (2000a,b, 2002, 2003), Yağcı & Turna (2002) who have performed floristic studies on Mediterranean coasts of Turkey

* e-mail: vaysel@comu.edu.tr

Material and Methods

Collected specimens were fixed using 4 % formaldehyde. Specimens belonging to *Rhodomelaceae* and *Corallinaceae* were exceptionally treated with 10 % HCl in identification procedures for specific cell wall properties. Mersin is situated between $32^{\circ} 33' 42''$ and $34^{\circ} 55' 16''$ eastern longitudes (Figure 1).

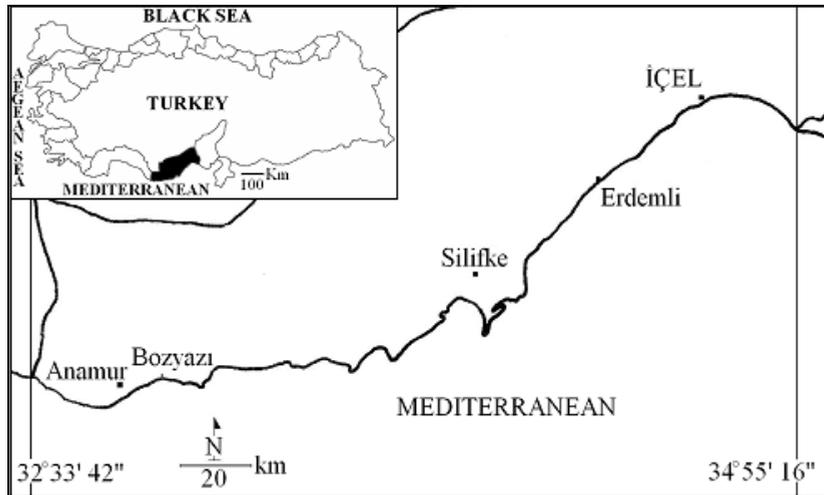

Figure 1: Map of Mersin coastline

Results

The list of the Taxa is given in Table 1. In this list, classes and upper categories were arranged according to Van den Hoek *et al.* (1997) and Guiry and Dhonncha (2005). Arrangement of lower categories, were followed by specialists [(Silva *et al.* (1996) for *Cyanophyta* and *Rhodophyta*, Stegenga (1985) for *Acrochaetiales*, Frederic and Hommersand (1989) for *Gracilariales*, Bressan and Babbini-Benussi (1995, 1996) for *Corallinales*, Gomez Garreta *et al.* (2001) for *Ceramiales*, Ribera *et al.* (1992) for *Fucophyceae*, Gallardo *et al.* (1993) for *Chlorophyceae*]. Additionally, the studies of Barbara and Cremades (1996), Ballantine and Aponte (1997) and Hardy and Guiry (2003) were used to create an evolutionary list of taxa above genus level. Taxa in species or below species level are listed alphabetically.

Table 1: Taxa distributed on Mersin (Mediterranean) coasts of Turkey.

Discussion

401 taxa (396 algae and 5 *seagrasses*) have been found in the present study. As seen in Table 2, the comparison of the number of algal species of Mersin with those of the other Mediterranean coastal cities of Turkey is given. Phycologically, one of the richest provinces of southern Turkey is Mersin when compare with the other cities of Mediterranean

Table 2: The number of algae species of Mersin and the other the Mediterranean coastal cities (MR: Mersin, MR*: (Aysel *et al.*, 1996, 1998, Aysel 1997a-b, Cirik 1986, 1991) MU: Muğla, AN: Antalya, AD: Adana, HT: Hatay).

Division	Studied Cities of Turkish Mediterranean Shores					
	MR	MR*	MU	AN	AD	HT
<i>Cyanophyta</i> (Cy)	36	14	40	36	27	30
<i>Rhodophyta</i> (R)	204	131	222	198	204	201
<i>Ochrophyta</i> (O)	82	62	99	74	78	73
<i>Chlorophyta</i> (C)	74	52	73	67	72	73
<i>Magnoliophyta</i>	5	5	5	5	5	5
Total	401	264	439	380	386	382

Species of *Sargassum*, *Cystoseira*, *Zanardinia* and *Styopodium schimperi* are the most encountered algae along Mersin shore. *Corallina mediterranea*, *Callithamnion corymbosum*, *Herposiphonia secunda* f. *tenella*, *Laurencia obtusa* var. *obtusa*, *Polysiphonia sertularioides* (*Rhodophyceae*), *Ectocarpus siliculosus* var. *siliculosus* (*Fucophyceae*), *Enteromorpha linza* var. *linza*, *E. prolifera* subsp. *prolifera*, *Ulva rigida* f. *rigida* and some of *Cladophora* species (*Chlorophyta*) are common algae of the area.

As seen in Table 3, number of *Cyanophyta* species is low in Mersin as same as other Mediterranean cities (Adana and Hatay). This division was not sufficiently investigated in these cities before from this reseach. Especially, Adana and Hatay shores in the İskenderun Bay have been polluted by domestic and industrial pollution.

While common taxa of the seagrasses *Posidonia*, *Zostera* and *Cymodocea* are also found in Mersin shores, some algae, such as taxa of *Herposiphonia*, *Polysiphonia*, *Ceramium*, *Ectocarpus*, *Enteromorpha* and *Cladophora* are common as epiphytically on macro algae (*Gracilaria*, *Hypnea*, *Cystoseira*, *Cladostephus*, *Halopteris*, *Dictyopteris*, *Dictyota*, *Cladophora*, *Ulva*, *Codium* etc.) and marine phanerogams.

Table 3: Dominancy in division level among southern provinces of Turkey

Division	Dominancy as cities in division level from the mediterranean shores of Turkey					
	MR	MR*	MU	AN	AD	HT
R/O	2.487	2.112	2.242	2,675	2.615	2.753
R/C	2.756	2.519	3.041	2,955	2.833	2.753
R/CY	5.666	9.357	5.550	5,500	7.555	6.700
O/C	1.108	1.192	1.356	1,104	1.083	1
O/CY	2.277	4.428	2.475	2,055	2.888	2.433
C/CY	2.055	3.714	1.825	1,861	2.666	2.433

Dominancy of taxa depending upon on provinces is summarized in Table 3. In this table, R/O values are relatively close among all provinces and changes between 2,242 and 2,753. (same as Antalya).

Özet

Bu araştırmada, Mersin (Türkiye'nin akdeniz kıyıları) kıyılarının üst infralittoralinde yayılış gösteren deniz algleri ve deniz çayırları çalışılmıştır. Toplam 396 alg ve 5 deniz çayırı tayin edilmiştir. Bunların 36 tanesi Mavi-yeşil bakteriler (*Cyanophyceae*), 204 tanesi kırmızı algler [*Rhodellophyceae* (2), *Compsopogonophyceae* (2), *Bangiophyceae* (6), *Florideophyceae*(194)], 82 tanesi kahverengi algler (*Fucophyceae*), 74 tanesi yeşil alglere [*Chlorophyceae* (7), *Ulvophyceae* (19), *Trentepohliophyceae* (1), *Cladophorophyceae* (25), *Bryopsidophyceae* (20), *Dasycladophyceae* (2)] ve 5 tanesi deniz çayıridir (*Liliopsida*).
