# DECLARATION Save, Care and Protect of Life, the pre-viable Preterm

*Right of the Life* and *Right to Live*, are the elementary one for *being* have a life and alive, especially considering the pre-viability of the preterm infants, thus, serve and save for supportive for health, shielding from problems, before establishing, principally for the

considering for the Vitality Right\*

\*Accepted at the Avrasya Hospital, dated 20th November 2019, Child Rights Meeting

**DECLARATION:** M. Arif AKŞİT\*, Ömür ŞAYLIGİL\*\* \*Prof. MD. Child Health and Diseases, Neonatology, Pediatric Genetics \*\* Prof. PhD. Medical History and Ethical Section, Eskişehir Osmangazi University Medical Faculty, Eskişehir

CONTRIBUTERS : Asiye NUHOĞLU\*, Türkan DAĞOĞLU \* Prof. MD. Pediatrics, Neonatology ACCEPTED

Avrasya Hospital, Child Rights Meeting, dated 20th November 2019,

## Statements

At the Equality and Human Commission, Article 2: Right to life, at Turkish Constitutional Law (Article 17); "*Each one has right to life, structural and moral presence, for save and developed, in progression*". Thus, it is clear and obvious, and additional *Right to Life and Live*, so, no one be faced to honor of humanity, objective and subjectively, also by social rights for live birth, as a basic of existence ad Human being, the individual rights and liberties be noted at the law also.

"Everyone has right to be life, in objective and be presence for developing and progressing right" is clear and obvious. In addition "no one will be performed torture, and oppression, no action be done for the honor of a person" indications are evident and apparent. One of the

Governmental duty, as in Article 5, "the main purpose and duty of the government are the personality basic rights and liberty.. thus, confirming the objective and moral authority, for developing and advancing be preparing" as noticed. Right to Life, the physical and psychological and social, cultural existence be saved and cared, and be grounded on legal and ethical principles.

As noted at the Turkish Deontological Principles, Article 2, "the health of the individual, the life, and personality for utmost care and serving" as the obligation, responsibility of a physician. In addition such subjects, at the Turkish Constitution, Article 10, and Turkish Penalty Code, Article 90, "if estimation of known medical procedures application is not enough result, by informative consent, even experimental scientific submissions, and for treatment approach, can be perform and not be a criminal consideration" is the notice by law. Physicians only be "for examination and treatment, utmost care and precautions ve obligatory be considered". Supporting the physiology and safety measures for the outcome of problems, beneficence, than the early or treatment of diseases. Delaying at medical applications be punished by the Turkish Constitution Article 137, and Penalty Code, Article 280, at the medical staff, even be silent at suspicious at this concept. The responsibility be an individual aspect as also noted at the Penalty Code, Article 20.

For healthy and be active living of a near-life preterm infants, especially below 1000grams, the physiology be supported and be required according their gestational week obligations. This will be following by evidences, ad intensive care precautions, especially specially for care as Perinatology at the pregnancy and Neonatology at birth and after life accomplishment.

This Declaration concerning; "Right of the Life is the elementary one for being alive, especially considering the pre-viability of the preterm infants, thus, serve and save for supportive for health, shielding from problems, before establishing, principally for the considering for the Vitality Right" as a brief indications.

# The Principles

## **1.** Legal concept

Right to Life is Natural Right; as live birth, or even at pre-viable preterm infant, each one has right to live, in legal. This right as a human being, must care and protect, by government and other institutes, not left only to family. To be healthy, all the precautions, health care must perform, by check-up and protect from symptoms before get disease.

- a) Legitimate be constructed on the personal right concept.
  - 1) No one will be punished if not indicated at law, clear and obviously mentioned.
  - 2) Administrative regulations cannot be considered at law as crime. Not comparison and evaluation be considered to the written law concept, directly be taken in notice.
  - 3) Crime and penalty for them will not be widely concern and be a comparison for other situations, as a legitimate fact."
  - 4) If not indicated against the action as crime, all be restricted any interactions and commercial relations out of law.
- b) Justice in Turkish, means *Rights of an Individual*, in English, indicating as *common idea*, therefore legal implying law, not juristical act.
  - 1) Every individual has Right to live and liberties, independency, as a personality and be protected from torture and for ending life decisions for them.
  - 2) No one has exact decision when life is beginning or ending and not even be clarifying upon this subject.

- 3) If the life support or ending life will be ending the presence, as living organisms, means cancelling all the rights.
- Government be search the cause and grounding of death as a "positive responsibility" as a fact.
- 5) Even unborn infant, fetus be have right to be born alive and be concern the save the life.
- 6) Termination of pregnancy is not only mother's right for decision; the right of fetus and mother is separated.
- c) For confirming the communication, effective and efficient relation is obvious. Thus, for the result and meaning be understand, special and unique interaction is required. Thus, the confidentiality is obviously be achieved.
  - Each person is unique and special and be individually has the Human Rights, by law, so same is also in consideration at the near-life of preterm infants. As indicated at the Turkish Constitution, Article 2 and 17 and as an individual responsibility (Penalty Code, 20), must inform to legal subjects if any suspicious act also (Constitutional Article 137, Penalty Code 280).
  - 2) Basically, informative consent is essential, thus, for Right to Life and at the near-viability preterm infants, family have only be taken the information, not have any consent, at medical procedures. If the family be not giving any consent, it is criminal act, some examples as taken the responsibility of preterm infant form the family given to government by Child Care Law, Article 5. Relation by communication and forthcoming accidents can also be solved by proper family member and relatives interaction. Certified personal act will be sometimes essential at the Intensive Care Unit of Neonatology.
- d) The main problems at the medicine, due to the accident at the communications at the relation, and legality be needed for taken the information, the medical fact.
  - Penalty only be considered at evidence based and proved crime facts, that written directly at law. At medical conditions, only some explanations be required, manly at the due period on clinical writings, especially nurse, other medical staffs and pharmacy indications and reasoning of performing. Primum non nocere is the main ethical concept, so, there is a reasoning and medical scientific grounding at the procedures. Information be given, thus, for preterm no consent is required by law.
  - 2) Crime is the confirming the harm, by intended, carelessly and without precaution, delay at the act, and fault, that only be recoverable one, be evidence-based proof.
  - 3) Mostly physicians gives the medical scientific reasoning and grounding at their act, at the court, mainly by the progress by caring simultaneously written chart, mainly not defense, mostly medical scientific informative aspect. Defense be only at the proven hazardous act proven.
  - 4) The first legitimate question at court, what will be your aim and your method that perform. At this point not abstract, concreter, objective actions, performing medical procedures and grounding and reasoning a medical science bases.
  - 5) The reasoning at the court, be as physician not gives any warranties for treatment and for to be healthy, so, caring and serving the physiological requirements, especially for the pregnancy weeks at preterm infants, assisting and following up for evidence to evaluation at the medical procedures. As life support is important at the reasoning.
  - 6) Informative state is differs at the physicians by themselves, and to the family, understandable and comprehension is needed. Relations and communications be at the same frequency with the focus on person.
- e) Not any oppression and insisting to perform, other inhuman acts, fits the nature is the conditional state. Only at emergency, and at the Right to Life status, the informative consent is required, thus, the preterm advocate is physician also.

- Not any reasoning at medicine for oppression and force using. Some conditions and problems as shock, near death, for recovering and resuscitation, the medical procedures are not considered as forceful and oppression. It is an obligation of medical procedures, thus, afterwards, the person be alive and tissue perfusion and perform what the individual needs, not less and not more.
- 2) For obtaining life, pressure, obligations by force, and be cruel is not physician role, thus the performed person be like hell, in torment. Therefore all the groundings at medicine be on medical ethics and firstly primum non nocere/not to cause any harm, later be at beneficence act.
- 3) Physician is not inflexible, be evaluative point for every evidences that obtained from preterm infant, for progress, by evaluative and differentiation.
- 4) Science confirm alternatives, other solutions, not any oppression. Some gives advices to be on standard routine, the others being on beginning point, thus responsible physician, considered the case, listening the advices and perform the required and suitable for the preterm infant, suitable for preterm infant condition.
- 5) No one knows what is righteous and wrong, just for estimation, so, the evidences from following be necessary for medical procedures, for contentment of requirements of the preterm infant.
- 6) Especially near life preterm infants consider and be carefully and preciously ve on medical procedures, so not to be harm, thus, they are even 1000 grams or less.
- 7) Contribution for ending life is not suitable for physician act, thus cause for life, torment and being in hell. Thus, for nearly life preterm infants, only Neonatology profession physicians be on duty, and the team for intensive care at this situations, for effective and efficient at life considerations.
- f) Medicine is not gaining or loosing fact, not mentioned any commercial and marketing, only medical education and scientific approach is essential and as a rule. The right of a person, preterm is overall, respect to them is utmost.
  - Gaining and profit perception be leading of missing, escaping and avoiding reasoning. At life, the cheap or like other economic reasoning is leading a person life, thus, in human an illegal. Economy is not only meaning as efficient, effective and eligibility thus also, enjoyment for the result.
  - 2) Requirement will be grounding on physiological needs, so it must be given, established, before any problems be encountered. Protection, care and serve, shielding for harm must be primary at the treatment. This is not considering the bells graphics at statistical median. Each person ve an exceptional, so individual conditions be considered.
  - 3) If possible benefit be in estimation, it must be given and follow up.
  - 4) The purpose of life for the physician, caring the near life preterm infants, not even pleasure, just love and reasoning of life, profession is humanistic, on ethical principles.
  - The evidences cannot be evaluated against the Human Rights, and against of Right to Life. Not any hopeless facts, to overcome and even be die in peace, without any discomfort, be the norms of medicine.
  - 1) Not any evidences be evaluated against the patient, for harm, thus even suspicious for impair, it is for starting the treatment.
  - 2) Some evidences be the first sign of the process.
  - 3) Not estimating and approved the condition, physiological balancing, cooperative function be at active role.
  - 4) Evidences be for indicates physiology ve over all them, not even reasonable and satisfactory, be effective and efficient and leading positive indication for balancing the tissue systems is vital important.

- h) Eutenasia is a crime act, even active or passive. Whatever the reasoning, as economics, retarding the early approach, before the pathology develops, late at care and medicine act. Medicine process cannot be considered as torture or production of pain, it is contrary for diminishing and terminating of them.
  - All medical approaches, concerning to leading of healthy and right to life. (The Right of Patients Regulation, Article 12: Without any diagnosis, treatment or other protective measurements, causing to death or dangerous to life applications or concerning the whole-body structure, or mental or decreasing the vital immunity, thus all are prohibited and not performed and also not be demand".
  - 2) Eutenasia is a crime. For the near-life condition of preterm infants, some advices of active/passive Eutenasia is not accepted legal and ethical fact, it is a crime and life change, probability must be given to them. (The Right of Patients Regulation, Article 13: By considering medical reasoning, whatever the indicated, not be get-out the life right, even demanding from himself or others, not be resulting to end the life").
  - 3) Utmost Care and Serve to the life (The Right of Patients Regulation, Article 14: *Medical person, must care according the patient requirements, even not possible to be healthy state or not save the life, be reduced the pain and take over it.*)
  - 4) Medicine is not given the warranties of healthy, and to be treated. The ethical, deontological principles is not give, perform any harm (primum non nocere) and be on benefit at health.
  - 5) Life is maintaining the balancing of the collaborative physiology of the tissues, and protecting from physiopathology is basic fundamental for protection from diseases and problems, so, primarily the championing of tissue system must be en essential process.6) Support of life, not at the ending life, ending the viability decision, so, Eutenasia is
  - illegal fact.
  - 7) The contrary of living (like Groningen Protocol) must be grounding on some reasoning as; inevitable and hopeless condition with pain and considering as torture, the demand of family for ending life, medical consultation is also approved the decision, and the process be in medical application, so, why not leading to death and, your deontological principles are for care and serve, even for abandoning the pain. Thus, life and living is taken as reality at Rights for individual, no one has right for ending decision. Physicians are advocates of a person for humanity.

## 2. Physician must be on ethical considerations

- a) The ethical principles must be as indicated.
  - 1) For ethical evaluation first revising the subject, as; "what is wright and true" as universal considerations at declarations, then later confirm the truth, by asking secondly "what to do, ought to do as truth" in action and follow the procedures.
  - 2) Each individual must take their essentials, requirement for life. The energy of living, at the preterm infant be specially estimated and all the tissue systems be in combination at consideration, to be healthy.
  - 3) The protection from harm by using the mind as a professional way is; a) grounding and reason of science, b) believe in science is to believe and to be with it like gravity, c) all the aim of work be for humanity at ethical principles, for value production, d) love and respect to the personality and special individual requests, e) be considering and to be on natural law, as physiology of specific one as preterm infant.
  - 4) Morals are at some specific regulative boundaries, thus traditions mainly considered. Right to life is on Constitution, so, especially physician take cre and serve for life. Ethical consideration be on individual human rights.
- b) To be on ethical principles

- 1) The important first line ethical principles are in general; a) trust, b) loyalty/fidelity ve c) keep the secret-secrecy/confidentiality.
- 2) In application the considering ethical principles as mainly are; a) primum non nocere/not make any harm, b) beneficial act, c) respect the personality and d) justice/do what is needed and required.
- 3) Some concepts for ending the life decision, as noted Groningen Protocol as; hopeless, desperate torture and pain occurred diseases, family has informative consent, medical assistance be given, ending be medically by team performed is mentioned. First no one has right to create and getting the life, ending the life decision, even the courts have no rights, second, physician is not a person giving warranties for healthy situation, and third, getting out the pain have several medicine, thus, care and serve the physiology requirements be safe and feel the comfort of the patient, preterm. So, medical staff has no way for causing active or passive death, leading to die. Eutenasia is crime, even not accepted universally by legal and also ethical fundamentals.
- 4) Care and serve is only for the physician, as a professional duty, using medical science by mind, decision be grounding on patient, specific and sole.
- 5) Moral is socially common sense, thus, civil liberties, individual rights are not connect and correlated with the society.
- c) What is truth and reality, what ought to do must be at the consideration at medical approach.
   1) The best escaping and be aware of harm is to be in medical science in combination with the preterm infant.
  - 2) Each medical procedures and applications must have an ethical and humanistic, thus the scientific backgrounds are a validity by the preterm infant effects and reactions.
  - 3) Non ethical behavior of a physician is not allowed for medical acts. Even if not love and respect to humanity, it is so unwanted to be on medical team.
  - 4) The meaning of life is for the humanity on the creation, by ethical principles, thus life is a limited lifetime and achieve what is essential.
  - 5) If you are very fast, on icy road, they said you are not using your mind, not avoiding from harm.
  - 6) Physician must be away of personal, social and other considerations, directly focused on patient, preterm infant health.
  - 7) Physician role is not creator position, be just on creation on scientific evidences at the preterm infant for Right to Life.
  - 8) If a person away of scientific aspects, just be on phantasies will not be care on preterm infants.
  - 9) Life consideration for healthy preterm infant, the evaluation of the evidences be differs, several ideas and medical procedures be applied, so, the importance is avoiding of harm and continuous evaluation of the evidences, for establishing biological balancing of organ systems, as a whole.
- d) Primum non nocere/escaping from harm is the first principle at medical application
  - 1) The target be on healthy, thus, for individual concept, each person is differs, each preterm is at each pregnancy week, physiology so diverged. Not to be pathophysiology be happened, early precautions is vital important.
  - 2) The person who is considering the medical approaches as torture, be configurate the preterm as a calm and be in peaceful, be at balancing of the physiology and tissue systems. So not in pain, suffocation and other problems, be the happiness hormones; oxytocin, seratonin, dopamin and endorphin releasing is the fact for them.
  - 3) To be away of harm, be also escaping to be a cruel one, as a physician be at the attitude of that subject.

- 4) Life is a running of time, by living, the effective and reactional state, side effects, advers effects all be considered and be at the consideration of time by following the preterm infant.
- 5) The physician at love on ethical concepts and be on Human Right, is not be a routine person, an exceptional, so, for caring and serving the near life preterm infant, not to be burnout, hope and love be active.
- 6) Avoiding is not performing anything, precautions and escaping harm is required medical procedures to take. Living is by life, so, no one has right for ending the life decision, even courts have not.
- 7) If a physician be at ethical consideration, not to have been forgotten not to make harm principle, as primum non nocere.
- 8) Before the pathological conditions be happened, estimation of the dilemma and be leading to individual evidences.
- 9) Only one disturbances be affected to whole body tissue/organ systems, so the balancing be upside down. So care must be taken for the entire organization of the body.
- 10) Complication meaning if a physician perform all the care and serving attitudes and concerning the precautions and unexpected conditional state. Thus, not any responsibility of the physician, thus be medical scientific evaluation by legitimate be done to say complication.
- 11) For encountering harm, proficiency at preterm infants, Neonatology profession is essential.
- 12) If not sure on harm, not starting any medical procedure.
- 13) Each person functional physiology varies, especially at the near life preterm infant, so, first to solve the organ systems of the preterm infant. The medical procedures limitations be known or in estimation.
- 14) Importance is balancing the organ/tissue system on functional aspects according their physiological background.
- 15) Not the educated and known person, thus, the one who takes the precautions be more comfortable than others.
- 16) Classical drugs for adults be harmful to preterm.
- 17) If you are not concerning the creations and the properties of the preterm, a later on the enormous increase of the problems cannot be resolved and be treatable, thus, even the physician be not understand what is going on.
- 18) The person o creation regulations, scientific properties, be safe on follow up, not at general thus, for special functions of the body, organ systems.
- 19) A person who is aware of and avoiding from harm will be an example at the common. The negative ones be also an example for evading. Each case an example and be educator to us.
- 20) There will be several for positive concepts, thus, harm is obvious at negative, so, evidences be first be not do any harm, primum non nocere.
- 21) For legal perspective, if there is some application for medical science, physician have to perform, if not it will be a crime,
- e) <u>Precautions and carefulness and taking the care, controlling and avoiding from harm and</u> problems be first to be at consideration. Walking on icy road is the way of controlling the <u>condition by care.</u>
  - 1) If someone be on at wrong direction, if not a crime, so their choice is at their responsibility so the overcome is goes to him/her.
  - 2) For precautions to consider and avoiding concepts at care and serve from the harm, first the concept will be in perceiving the detriment and awareness the human Rights, by scientific and ethical considerations.

- 3) For avoiding the harm, not after an accident happens, before taken the precautions.
- 4) The precautions are concerning the concept of harm, so, avoiding has special procedures to do.
- 5) If there is any astonishing factor, we must take precautions and avoiding it, thus this is care and escaping the harm.
- 6) Before the problem is occurred, physician be care and save form the problem, so, precautions for establishing the organ system balancing o healthy process, be the main aim of the medical science.
- 7) Care for healthy is the basic concept, so for preterm infants, tissue systems be all together in functional state.
- For serve, functionality and care of the preterm infants, action is required, the decisions be on active and performing.
- 9) Living is continuing process, yesterday and today is confirming the tomorrow. To be alive, we must take care and serve to be healthy, escaping the harm, health care controlling, for taking precautions, thus near life preterm infants, to survive, balancing the physiological functions.
- 10) For effective and efficient, be sure on the physiology of the preterm infant.
- 11) Before establishing health problems, early detection and precautions vital important, then treatment. Thus, therapy is not so returning the beginning point, mostly confirm some damage.
- 12) For health controls, to be on safe at the problems, early diagnosis and taking and consideration of the conditions and difficulties be better than treatment. The probabilities be for healthy concepts for taken the caring as in pregnancies.
- 13) A created person is not be at opposition for the creation, must be on the scientific factors for alive. Science is not contrary to creation; nature is law of it. By such perspective, physician be so sure being on it.
- 14) Medical approach and procedures are not at one system, must consider all the organ system, in balance and at proper functional state.

## 3. Right to life

Presence, primarily independent, and separate as a free person, to be in healthy, be equality and at brotherhood, perspective, as a member of the society. All rights must be have unlimited and uncensured, by free will and free individual perspective. For preterm infants, first the right to life be achieved and be provide, performed and appreciated.

- a) Being, to be is evident, objective, thus if not, it is just a hypothetical, abstract one
  - 1) Life is not a deniable truth. Living body, organism has some objective medical criteria, concerning as living, not any argument.
  - 2) All living organism is created, born, thus, human being is also, born, live and death.
  - 3) Not accepted the living one, means concerning them as death.
  - 4) Denying the life, means also refusing yourself, your creation, your being.
  - 5) Physician is for life, not for death action.
  - 6) A physician cannot give life and health warranties, the creation and death is not personal controlling. The aim, to act at humanistic and respect of the person.
  - Respect of life is equal meaning of respect to humanity and presence of human being.
     The medical act for the Right to Life, each preterm is unique and special, so procedures
  - be upon their physiological needs, so considering gestational week, by clinical outcome. 9) Right to Life is natural and legate being. Presence as a human as a person, so, no
  - comparison, no evaluation and considering any subject as discussion.
  - 10) Social status is arranged at law, before birth and by alive birth, it is active and not to be taken for any reasoning.

- 11) Life is not at consideration, even for medical approach, at pre-viable preterm infants, life is to be or not to be concept, thus not at evaluation.
- 12) Life and to be alive is clear and obvious, by evidence based. Not to be in deliberation by philosophical concepts, and not bearing in mind at the physician. Even for disabled, handicapped ones, this is legally forbidden, means crime.
- 13) Each medical approach, also treatment, specific for person, and in general contribution of health, specially be harmful, so, be noticed the person requirements, be effective and efficient and satisfactory.
- 14) For the Right of the Life, even before procedures are useful and be effective and beneficial, this is not indicating as same effect at this case, the preterm.
- 15) Not any miracle is expecting, for medical procedures, for living, the supporting specific patient physiology might have a dreamful effect, thus it is only a medical scholarship and believing of science be heightened.
- 16) The life has no illegal explanation, meaning.
- 17) Establishing of the living, as a Right to life, the concept of being, be only one to be.
- 18) The reality and rights of life is active living. The future will be only by living organism, by support, care and serve, on the whole be for physiological managing.
- 19) Under the concept of humanity, medical staff, first be on the creation requirement, the essential and natural resources for care and serve, protect form harm and damage.
- 20) Life is sooner or later be ended for living organism, thus first be alive for the preterm infants, so they will ve learn the meaning of life.
- 21) At the life consideration, Right of Life is vital, crucial at be mandatory. Fir confirming life, as a living person, all the medical science and creation concepts be actively done from the aspect of preterm infants evidences.
- 22) From the humanity perspective, by ethical principles, life is the respectful fact for Human race, for future presence, and protect and serve and care of health is compulsory duty.
- 23) Life is a delight for living. The meaning of life for realizing, by pleasure of life, thus, for implying all the living organisms as outlines as love.
- 24) All the medical procedures and applications, treatment, to the near-life preterm infants be performed, thus, it is obvious. This must be at the individual bases of requirements for life.
- b) Life is designed by love and humanity must be progressive and over for all and advanced.
   1) The meaning of life is love and production of love affairs.
  - 2) Life is positive and negative outcomes combination, so each condition and situation be a lesson, even at the individual case, by ethical principles, balancing at the humanity love and respect, for living one.
  - 3) Approaching by love has several positive effect at the physiology support, care, precautions and serve has not any arguing, thus, only be how, when and what to do is at the consideration.
  - 4) The main reasoning for physician to be a medicine as a profession, for being humanity by love, thus Turkish Deontological Principles as noted; "*the duty for physician, to respect the human right and individual life thus, personality with care and respect to be leading factor*".
  - 5) If not love and respect under humanity, the physician be like a robot and act as same indications at the references, books, not consider human being for relation and cooperation.
  - 6) For performing the Right to Live, a medical staff is sure on humanity, ethical principles, with leading of mind, by love, at energic acts.

- 7) At emergency facilities, not directly whether live or not, perform what the preterm is need and required the medical procedure, full satisfactory and effective procedures has to be done.
- 8) Well education and aptitude and experienced physician must have a medical team; thus he/she is responsible for their proficiency. Anyone who has any hesitations and worrying will not working at Intensive Care Unit.
- 9) When you discharged to home a critically small preterm, be quite sure on you and the baby both are in success, you to life, preterm to you success, experience, gives lesson too.
- 10) The communication langue be love and friendly way, relation and interaction be only by respect to human.
- 11) As a reality no one knows the future, what will be happen, thus, medical procedures for healthy with tissue systems be actively at balancing stage, according the preterm infant.
- 12) For overcome the professional burnout syndrome, for caring the near-viable preterm infant, being with humanity, and ethical principles, thus, all the medical staffs be at respect and in affection of friendship at the relations.
- 13) Occurring of problems inevitable, the concept to be at the ethical considerations and be at humanity.
- 14) New graduated physician is a one, breaking the pupa, the eggshell. Be ready to contribute the humanity, ethical contributions, on love by health and be on humanity.
- 15) If living is a struggle, then, it must be on love at peace, being on humanity, by medicine science for physician.
- 16) The science be sole, thus, the presence of being, on love at peace. Not encountered any problem, not cause any harm, if being a status at biological, physiological and balancing by healthful, medical process.
- 17) Basically, suitable at the creation system, natural regulations on science and be on humanity and ethical considerations by love can be the perceive the making the awareness at the medicine.
- 18) When the medical staff act with love, the internal hormone secretion as; oxytocin, seratonin, endorphin, dopamine be actively cause positive effect on tissue system balances. This is easily encountered at the vital evidences at the monitors.
- 19) For medical approach and medical procedures, the technology established equipment has be effective and efficient usage, thus, humanity acts be also required aspect.
- 20) Physician at the reality be on love at humanity at an individual, making empathy and save and serve the existence, presence of Human being, as an individual.
- 21) If some medical staff is only considered the preterm as an object, not making empathy and love it, so, not to be worked at the intensive Care.
- 22) Look down, despising and do what you have to do, is not physicians concerning duty. The subject is a human being, even preterm are also, so, be care and serve them as a humanoid.
- c) <u>Meaning of living is; independent, not any dependency for life, individually and to be alive,</u> <u>naturally at living organisms</u>.
  - 1) Protecting from physio-pathological condition, the first aim be serve and care and establishing the physiology of the preterm, and balancing the requirements and outcome.
  - 2) If not balancing the tissue systems, even to the cellular function, then the problem will be obvious, not be avoiding one.
  - 3) Autonomy may not be keep in balance the tissue systems at preterm infants, so special care and serve, according their gestational week and maturation parameters, evident approach be critical.

- 4) Each medical procedures to near-live preterm has an effect, thus, also counter effect, reaction, by this influencing, thus, cellular function be the pivot for evaluation.
- d) Life has no concerning any discussion, not have any pessimistic approach
  - 1) As if look like weak and not any way of solution, the immunity and reaction of the body, by supporting physiological outcome, the condition be on positive direction.
  - 2) By death, not any energy is needed, so by energy using, preterm infants be try to overcome the problems for healthy situation.
  - 3) Human is a social person, not isolated form the society, being share the professional experience to other medical collages and from family informed consent approach is also important in some cases.
  - 4) When considering the near-life preterm infants, the evaluation of the evidences, not any hopeless and not unscientific explanations, also miracles and fantasies being leading to destruction and not anything.

## **4.** Continuing of life is female dependent/only confirm by woman.

The person who give genetically birth to Human being, is female, by pregnancy and labor. a) If the new generations be only by female pregnancy and birth, the woman health is prime

- <u>important</u>.
  1) Genetically the new generation is mixture of mother and father genes, thus, the "X" chromosome is vital important, and "y" is for sex discrimination. Female is the only and sole sex, forming human from single cell, to a newborn baby.
- 2) Therefore for new generations, female health is up most important, and also for the embryo, fetus and vitality of the newborn infant.
- b) The legal and ethical standards for abortion and early discharge and delivery
  - 1) Up to 10 Gestational Week; the mother and embryo rights are considered as united, so, mother can consent for abortion.
  - 2) Between the 10-20 Gestational Week; the mother and fetus right is diverged, so mother has no consent for early discharge, medical and legal reasoning be required.
  - 3) Between 20-22 Gestational Weeks; nothing is reasoning for ending life decision, except vital health condition of mother.
- c) At the nature, only females are given birth, life consideration to them.
  - 1) For continuing the Human race, female is essential, thus, healthy woman is the aim of humanity, to have a future of human species.
  - 2) Mother is the Human being, gives birth, so, all the life and humanity concepts be connected to females. Woman is a symbol of humanity, love and respect of the common, so, this conceptual respect be on enthusiastically presented.
  - 3) The life is starting from pregnancy, so, the prenatal period be at healthy and vitally most vital stage, period.
  - 4) Even before pregnancy, healthy controls and evaluation of health is for healthful.
  - 5) When the pregnancy at risk, first consider the mothers health.
  - 6) Female, as a woman, must be close related to their profession as Perinatology as well as Woman Health professions.

## **5.** The unit of life is person/The meaning of life is a vital individual

All the person has autonomy, and equal at value as human and for Human Rights, born the same civil liberties and rights. Equality cannot be considered at the discrepancy (race, colour, gender, language, believes, political view, religion, origin, richness, and differentiation at birth and other discriminations), so equality is at legal rights. Slavery or other dependency will not be acceptable, their informative consent is obligatory essential by law, not performing any harm and torture act, inhuman behaviour and brutal to honor

and such attitudes will be tolerable and be a crime. Friendship is the perspective at the relations and cooperation.

- a) <u>Human being as an individually, free and special, unique person, free on act.</u>
  - Civil Liberties and serve and care of this item be governmental and institutional duty be protected by law concept.
  - 2) People are independent and unbinding, free and equal, unique and special, sole at law.
  - 3) Free in mind, free in heart, free at thoughts, and free for future be an personal conditional state to be.
- b) Each medical procedures, for individual situations and conditions, as demanding healthy state, unique and special and sole. Equality is as a right for humanity resources; thus each individual is one and only, particular and distinctive.
  - 1) Each case an active vivid one, by considering as a lesson subject, and being several contribution to medical science.
  - 2) If not considered the physiology bases, the medical procedures cannot be receiving positive result, thus, even treatment must lead to balancing the tissue systems too.
  - 3) Nature is on scientific factors, thus, for life, energy be used, for life.
  - 4) Before medical approach to a preterm, first you have to be on ethical principles, respect to human, making empathy to preterm, respect the life.
  - 5) Medical procedures are grounding on the case, preterm, thus, must the medical approach be similar to their physiological requirements, like a tailoring.
- c) Equality is meaning equal at the Human Rights, the biological peculiarity, distinctively, personality and discrimination is a structural reality.
  - 1) The regulation that was from manager, is not crime if not performed, as a origin, as at law, only harm and oppression be a crime to Human being.
  - 2) The discrimination be only for, the individual freedom, and the Human Rights as unique person, name, ID number, persona record, chart.
- d) Each drug has special actions according the case, properties, conditions, situations and diseases, depending their psychopathological bases. Thus, the reaction must be also encountered.
  - 1) By giving or not giving any prescription, the preterm be prepared for the administration or the lack of the conditions.
  - 2) The unbalancing physiology of preterm infants estimated the unintimated reactions to the medication.
  - 3) Giving a food is not digestion and metabolism of the nutrition. So, the medical caring be up to last qualified state.
- e) Each case is a lesson, even the negative ones be the example to be escaped and not to be dome, each, positive and negative results be for education on medical science.
  - 1) To be obtaining lesson, all the medical procedures, even be positive or negative will be a real experience, thus for the vitality on preterm infants.
  - 2) Positives can be a lesson to repeat, negatives be avoiding example to us.
  - 3) When a preterm is died after several days medical care, this will not be burn-out effect, thus be more power for the new preterm to overcome the conditions and problems.
  - 4) Each case is a lesson at reality, being an exam, not written on books, not be a copy of other preterm infants.
  - 5) Education is from past to this time, thus leading the upcoming and over the future. Arrangement at the education and proficiency be for new outcome.
  - 6) The lesson be based on considering the balancing of the physiology and overcoming the pathological outcome.
- f) Example at the Neonatology is not reciprocal, each preterm is differs and unique so, be on medical scientific concept for intending and arranging the procedures.

- 1) If you are obtaining reverse findings, this must have a scientific explanation, so, be on science. By other parameters.
- 2) Educated, Neonatology Profession physician has a lot to indicate for serve, care and protect the patient, preterm infant.
- 3) Experience must lead now perspectives and nee approaches.
- 4) Too much know person, can make much faults, so be careful and be unique approach at the preterm infants. The main concept is treat the patient not the disease.

## 6. Respect to a person, means respect to human dignity

- a) Respect to a person is grounding on the Human being, the creation.
  - 1) Respect to a person, a preterm, because of Human being is the fact for medical impending. As a creation respectful is the leading act.
  - 2) Created ones never be a creator, physician cannot be give life, thus, supporting and medical resuscitation is contributing life to a newborn infant.
  - 3) Treat not the disease, treat the individual, the preterm.
  - 4) The most noticeable act of a physician is respect and obey the individual rights, be Right to Life as simple for living.
  - 5) Viable is the proof of a individual, thus, for being on humanity is the reasoning for this.
  - 6) The value production or establishing is the meaning of resuscitation, is Right to Life or their life being.
  - 7) Unification of medical team at the Intensive Care of Neonatology Unit, be on humanity and Right to Life, and on being concept as living. Apart of this subject will not be together at the medical team.
- b) <u>Human as an individual, a value, a treasure sole and single, not any discrimination, evaluation, and comments, also not put any grouping and measuring about the importance and significance.</u>
  - 1) Each person is precious and have a value.
  - 2) A person with health problems and even handicapped and abnormalities, doesn't change the value of being a Human and have equal rights.
- c) The aim and concerning a case, not form economic perspective, from humanity one
  - 1) Economics on health, not considering the payment, what to do must done.
  - 2) Economy depends on civil liberties, on human rights, as be considered the facts as (4E);a) Effectivity, b) Efficiency, d) Eligibility, useful one, e) Enjoyment, Fulfilment, not confirm any impairment as indicated as contented with satisfaction.
  - 3) Economy is not meaning as cheap, for evaluation, the perspective at humanity, the individual rights ve the love and, empathy, individual demands, as pride and grudge, not cause any harmful to common.
  - 4) The meaning of saving and protecting the life, the lifespan will be on for value production, to be on humanity. The most valuable respectable one is the gaining of hearts.
  - 5) The significance of value must be guard upon economy principles, the continuing shortly be reliant on healthy, be utmost vital one.
  - 6) For living, first to be alive. For a personal life, being an individual rights, as a Human Rights and contractual obligation of general outcome of the government, as an obligatory functional duty.
  - 7) When concerning life, not arguing on cheapness or economic perspective, just for effective, efficient and proper for individual health requirements. The person is unique and sole, so the concept of economics be also eligibility, clarify, acceptable pleasing on health. The quality on health is just to be convinced the physiology.

- 8) Purpose and aim, mode of employing medical approach to preterm infants be on humanity and ethical principles. Serve and care of the health of preterm infants, their cellular, tissue functions, oxygenations, metabolism, physiological functions, as vital balancing be the aim and mode to employ.
- d) Inhumane Approach at the medicine is illegal, crime act
  - 1) You can be get the result, thus, the position of physician be important, being on individual rights and humanity and ethical principles.
  - 2) Life is a pleasure for a living organism, thus ending be losing completely the fact of life and earning, winning of it.
  - 3) Complication is not a crime; if the groundings and resounding be on medical science, on ethical principles, appropriate to the case, patient, preterm infant, by care and serve with causation and concerning the case facts.
  - 4) Crime is obvious and evidence on proof, making harm, not any suspicious fact.
  - 5) Physician will not work on order, or other comment, thus only be patient evidences and medical science, personally be responsible on it.

## 7. Presence, being is only by vitality of an individual

- a) As a created one, we are, by the creation process.
  - Life is a consequence of the creation. We are, also all the living and non-living organism and items are structured from atoms and energy, thus, configuration is not same, some qualifications. The exceptional structure be taken in notice, physiological, anatomical and other body items, so be awareness on it, be serve and care of them, due to their configuration.
  - 2) For establishing the individual physiological requirement, the condition and causative factors ve know, by medical method, examination of the preterm.
  - 3) Creation is helpful to the created one, as Human being, thus natural laws be on activity at living organism.
  - 4) Living in some perspective, appropriate to natural law, regulations, escaping from harm and serve and care of the life in every manner, even at preterm infants.
- b) Appropriate to the creation means, being in science. Nothing being a part of science and not at scientific evidences are not on creation. Nature is creation application; all are on science and natural laws.
  - 1) Creation is completely scientific and no exceptions, as fantasies and fairy tales.
  - 2) If you believe the science, and performing on medical science, will not be a coincidence and wonder, miracle is not a scientific fact, just be an extraordinary conditional state. Thus, confirming the physiology of a preterm is a medical science on individual evidences.
  - 3) Physicians grounding and reasoning on medical science, by the evidences of the patient, preterm infant, and not be on harm and wrong direction too.
  - 4) Physician be respect to medical science, and be on natural concept of the science, at the act of medicine.
  - 5) Creation is not at our control so, we have no idea on future, so, performing what we have today, by estimation of yesterday progress.
  - 6) Medical procedures be on reasoning and grounding on science and be at same standards.
  - 7) Physician is not quarrel on death, not contrary to the creation, accepted the reality, and try to overcome and be care and safe, on healthy. Not giving guaranties, any assurance, for treatment, just what the necessity is required.
  - 8) Living is continuous energy using, meaning of life is at the creation be active.
  - 9) Creation is by accepting the creation, the functional conditions and situations of the near life preterm infant, be scientifically be at the same way on it.

- 10) The requirements differs especially to the gestational functional growth and development, with maturation, so, physician must consider at that objects at the patient.
- 11) Life is on the creational laws, so, for caring life, complete suitable application has to be done.2) The second se
- 12) The medical approach and treatment is not the same at the patients, as each person is unique and differs at their tissue systems.
- 13) Caring the tissue system function for harm must the principle aim of the physician.
- 14) Each living organism must be on natural law for alive.
- 15) The physician on life is also on science with at the same creation concept.
- 16) For vitality, there are several feedbacks and regulations, so, they must be in function properly, for the preterm infants, we have to help them to work well.
- 17) In order to be alive, biological balancing be at the natural law principles, if unbalancing, there must a problem upcoming.
- 18) For keeping a living organism alive, not the probable effects at first, the primary one to be, basic medical science mostly on physiological needed.
- 19) At the philosophy, answering the who, when, why, which and where to whom is the basic fundamentals, thus same at scientific arguments.
- 20) Medical procedures and applications, treatment must be on medical science. Near life preterm infants, even a slight indication of life, continuing the Right to Life.
- 21) The real science and educator is the patient, the near life preterm infant, so not to put the case to the statistical boundaries, just consider, each person is special and unique, so, do what he/she desires.
- 22) Caring, protection and considering of awareness and precautions be on science and reality, not on fantasies or fairy tales.
- c) <u>The conditions and happening be similar thus, not same. They are unique and special, not for separation and differentiation, the rights must be on equality, same on Human Rights on legal perspective.</u>
  - When physician is on scientific perspective, the incapable concept will not be considered. At natural science, it will be as it is, not any paradox and counteract act. Oo All the obtained result be evaluated by the core of patient on medical science, for understandable and what is going on.
  - 2) No physician will be against the medical scientific regulations.
  - 3) Not any miracle will be at true, considering the natural laws, the medical applications must be on grounding to this facts.
  - 4) Physician only be on nature, science indication, for protection and care and serve.
  - 5) For opposite actions than the medical science, as patient desire and consent, will not be an acceptable fact, no physician be at the habit of country to science.
  - 6) Several relations and correlation and cooperative functioning of the body functions, so, physician must consider all, thus, be influenced the body, not only one tissue system.
  - 7) Close correlation on medical science regulations and be togetherness as the law aspects is the way to do.
  - 8) The creation perspectives be on the case, the gestational week and growth, development and maturation of the individual. Thus the response end effecting be also special and unique.
  - 9) If you are in minutes late, the regretting and remorse never be healed, in emergency situations especially for preterm infants. 000 The physician on medical science and for performing the healthy status by care and serve, will be creative, renewed in any manner.
  - 10) Working for value establishing, also at individual appropriate to science.

- 11) Physician by using mind, not try to put a boundaries at application, treatment, by confirming the case evidences for the biological aspects, also by empathy is way of considering.
- 12) Science has same rules; thus, it must be adapted to individual conditions. Medicine is specified, tailoring the concept to the individual requirement.
- 13) For beneficence result, being on medical science is essential.
- 14) We have to compromise to be on physiology bases, mostly be on pre-causative conception.
- 15) No one be continue their physician act, without science and ethical concepts.
- 16) Physician is not a creator, thus, be on creation and learn and applying on this regulation for effective and efficient on medical treatment.
- 17) When considering the creation, as a created of Human being, for healthy, first be noticed each of us have special functional state, especially preterm infants are quite special. Therefore we must be on suitable functional state as the patients have being.
- 18) Each physician be in comfort, when on medical science.
- 19) Creation be on tissue, cellular function, so, each relations be at cooperative purpose, thus, making a harm is affecting all the body systems.
- 20) For life, adaptive to patient functional physiology needed and must be performed.
- 21) Each person is similar, not have extra eyes, so, this is not meaning as same, each one unique and special, not be considered equal, even at identical twins .
- 22) For establishing a value, some knowledge and ability with profession is obviously essential.
- 23) At the creation, no one has the right to control and no one is responsible on it, it is as natural law concepts.
- 24) The life concept and philosophy of a physician be also on scientific concepts. The trust must be inevitable like believing of gravity, we are in and effective always.

# **8.** Life is only a limited time period, a life span, and afterwards death is inevitably being

- a) The happenings being similar thus not the same, thus, the conditional happening time is obviously different, not at the same time.
  - 1) Effective and efficient productivity, some basic standards and procedures must be on the vitality. If all of them be satisfactory required, thus, preterm infants, has special functional structure, so be on this individual demands, not at standard approach, just be suitable and functionally for them, with their evidences obtained from them be giving the benefit.
  - 2) Life is not a retainer, advance for spent, thus, for escaping harm and destruction, not be cruel, be on and in love, for a short period, called life.
- b) Effect and reaction confirms themselves.
  - 1) Time period is important, exact one be done at the exact time is a rule. Therefore all the equipment be ready for use, not any seconds hesitations.
  - 2) Physiological balancing of all the tissue systems and performed for the needs, be essential for complications and problems, for being a safety function.
- c) Life is a restricted period; life span is one day be ending. Due to the creation, each living organism will taste the death. No one, no reasoning be for ending the life decision, not evaluated, not discussed, not advisable, even at the medical approach, consider that, life is limited time.
  - 1) In emergency time is important as also at preterm infants, the be in late is crime of intended to kill.

- 2) The time evaluation can be considered form preterm infant perspective, and not to be late, that leads some problems, sooner perform, eluding the problems.
- 3) Each experiences, treating and discharging near life preterm infant, is not meaning to know, just be active on the recent case. So, there will be no strict rule, the abstract rules and principles be the one to follow, as care and serve the biological functions, in ethical fundamentals.
- d) Life is a mixture of positive and negative happenings and conditions. The important aspect is, we must be on humanity and on the road of ethical consideration by individual civil liberties and Right to Live.
  - 1) Birth and life, as a reality death is obvious truth.
  - 2) Not taken as advance and profit for life, by reasoning escaping from harm and not be cruel one, be the best for awareness to be a human.
  - 3) Life is one day be ended, the importance is protection from harm and hazardous act, to be on love and respect at Human Rights. Returning the Nature, the Creation is the death of a living organism as reality concept.

## 9. Nature is active living ones concept

- a) Life is meaning on activity, by energy is needed for the action. Natural laws are always in action; thus, time period be also one-way indicator pass by.
  - 1) Life is a second process, not only for heart stopping, not efficient output be also not effective for life support.
  - 2) Time is abstract, thus definite at the emergency applications. It is medical procedures to be concern.
  - 3) Life is a limited days for alive, not known the duration. First the Right to Life is for being, so at birth a preterm be alive, with indication of life.
  - 4) To be effective and efficient, there must be medical approach, and not to be harm, thus, personality be serve and care for health.
- b) Living is by energy supply, thus for living the source of energy is primarily vital.
  - 1) If the most important factor for growth and development is nutritional state, not just giving the food, digestion and metabolism must be in advance, thus first energy is essential for activity, in addition to structural confrontation.
  - 2) Feeding is not proof on it will be digested and metabolized. There must be process to follow up.
  - 3) Living be only being on the creational regulations, by using energy.
- c) <u>The newborn infant must adapted at the birth, delivery, the physiology that we live in,</u> balancing and adjustment be performed for healthy live.
  - 1) Life is a balancing under the scientific organ systems in cooperative state. For living organist m, there must be a load to carry on for healthy.
  - 2) Life is not a stabilized and standard process. Negative and positive conditions may break the equilibrium, and bias effective end reactive conditions.
  - 3) If the necessities are not obtained, the life will not be survived.
  - 4) Medicine is a teamwork. Intensive Care Unit, this will be for 24 hours continuously observed and estimated the requirements and performing medically as soon as possible.
  - 5) The proceeding method is like a spider web. Case at the center, the other professions, medicine, nurse and pharmacies at the same distance, even any movement, evidence all must be informed and be active for medical performance. The medical professions be active continuously, at 24 hours for days and even months for preterm infants.
  - 6) The medical approach must be by standard and regulative one, may cause harm to preterm infant. Decision be upon evidences, perceiving the problems before the

pathology verified, that continuously evaluated by Neonatology profession and Intensive Care Unit team.

- 7) Medical approach is not only for the problem, considering the all body, tissue systems, that will be cooperative and regulative together with.
- 8) Establishing the life is important and continuing the healthy state is also an important standpoint.
- 9) If life is a reality objective fact, the evaluation of the state for precaution is also required. 10) Life is not as meaning, be on functional state, preterm infants be on growth,
- development and advanced to be healthy progress.
- 11) If not in balance of requirement as efficient, effective and sufficient for tissue system functions, less or over is both makes harm.
- 12) Precautions, for being healthy are mostly grounded on the balancing fact.
- 13) The best known one is not the best have knowledge, for understanding and confirming the perceiving the evidences, before the problem or pathology develops.
- ) The work for health is continuous act during the life period.
  - 1) After performing the medical procedures, as treatment, the follow up and controls of the health is essential, especially at the preterm, growth and development and configuration of the progress be under supervision.
  - 2) Continuously following be for the evaluation of the functional stat, the healthy condition for early precautions and avoiding the problems.

## **10.** Responsibility is individual

a) Medical Science Evidence-Based Approach:

A physician not obligatory on Group A, thus by medical science reasoning, grounding on personal factors, be also at B to D application, thus at some, by ethical committee approved. At legal and deontological perspectives, if individual requirements, must be on these Procedures. Evidence Based Concept as Summary: At the grounding of evidence-based medicine; A Group: perform, B Group: may ve perform, C Group: on case report for to perform, D Group: discussion and later be perform, E Group: individual decision. Randomised systematic studies and statistical results is not indicates the individual case evidences. Thus physician confirms the perspective from the preterm infant.

- 1) Group A-DO: Systemic, randomized clinical studies, nearly 5-15% differs, be done, or first line decision to perform.
- Group B- Appropriate to DO: Grounded on controlled studies, systemic collections, cohort studies, nearly 80% clinical studies.
- Group C- According to individual aspects: Case controlled, systematic collections, case, patient controlled studies.
- 4) Group D- Discussions: Series of cases, not controlled Cohort or randomized clinical studies.
- 5) Group E- Discussions and personnel comments. Expert Opinion, discussion evaluation, value analyzing studies.
- b) <u>Responsibility from specific private assessment</u>
  - 1) The obligation of the responsibility of the physician are; the care and respect of the health and individualistic personality.
  - 2) Basic rights and liberties, concerns, the person to the community, family and other ones, as humanistic duties and responsibilities.
  - 3) If a harm causative order is illegal and be crime at the application, so not to be performed, no one be escaping form the punishment, responsibility is own-self.
  - 4) Responsibility is individual assessment. No one accused from others duty, performed one. Thus in togetherness, as a teamwork, each one will be responsible t their work,

thus, in medicine it is covered all the person, physician, nurse and pharmacist also, just the accusation and penalty be only differs.

- 5) No one accused and punished if it is not indicated, on written law, the regulative orders are not at crime concept and not be punished.
- 6) There will be no comparison and not widely evaluation at the crime facts and not be a comparative decision.
- 7) If the physician is not be benefit and be on decent result, what is done, by informative consent, in case of Right to Life no required the consent, self-responsibility the detail so, even it is a scientific backgrounding tentative trial, no crime accusation be mentioned.
- 8) Even satisfactory experiment was done scientific medical applications under estimation of benefit, and not cause any harm, can be thus employed and recommended. Thus not any wrong comment be indicated, as advertisement approach.
- c) <u>Neonatology Specialty ve taking medically care at the preterm and problems of the newborn</u> <u>infants.</u>
  - 1) For Neonatology profession, the preterm infants are their meaning of being, education and also a way of life.
  - 2) For overcoming the near life preterm infants, experienced Perinatology and Neonatology professions is obligatory. They combined and cooperative medical approach, is statistically reduced and resulted better results.
  - 3) More the problems encountered, the most depending to science, even at the pregnancy, both Perinatolog and Neonatolog proficiency be more cooperative for solving and care and concerning it.
  - 4) For overcome the burning syndrome, working and discussion and sharing the feelings between the medical staff, in a comfort place. Education related to case is also performing to overcome.
  - 5) Medical staff discussed and decision made near the infant. The action is at the bedside, so the evaluation mainly the perspective.
  - 6) Life is a sharing of the human affairs, Neonatology presence is because of preterm and problem accrued newborn infant, so, living of preterm by the Neonatology profession, sharing the meaning of spirit.
  - 7) There will be no other power for the caring health staff, professions, near-life preterm infants, medical science by love to them by mind and heart unification is the fact.
  - 8) The medical staff on medical science that perform for the near life preterm infant requirements, and balancing the tissue system functions, be also feel safe, for legal investigative and arguing conditions.
  - 9) The education of Neonatology profession is continuous, by caring and serving the preterm infants, thus, they are the teacher, educator of the physicians, and medical staff.
  - 10) The perspective is not gaining, earning in advance for caring the near life preterm infants, thus, ethical and moral winning is the utmost important.
  - 11) The medical staff, who loves and cares the preterm infants can work at Neonatology Intensive Care Units. Even hard education, working and confrontation the conditions and problems are also very hard to tolerate, it is life or death situations.
  - 12) The desired one is not discharge, healthy state and following, care and serve by precious controlling, protecting for the complications, before happened be the aiming one.
  - 13) Medical action is going on, the discharging means a new preterm is approaching to born or for intensive care. So, each care perspective is educative to new ones.
  - 14) The efficiency and proficiency at the Intensive Care Unit at Neonatology be only by scientific and progressed staff with technological advanced equipment.

- 15) In Neonatology, mostly medical applications are not required consent, thus, information must be obligatory and willingly be given to family, in understandable way, for reliving the and also have been in hope.
- d) <u>Physician be also an advocate of preterm, for care, protect and shielded from harm, and treatment later on.</u>
  - 1) To be healthy, the medical science is more common and be obvious, so, considering to be physiological balancing is the aiming subject, not to be disturbed it.
  - After discharge the preterm infants form the Intensive Care Units, controlling and checking the growth and development is required, thus, for considering the childdevelopment problems.
  - 3) Physician is for health care of the preterm infants, thus, be an advocate for this efforts. Not any consideration from the harmful and take care also precautional acts from the problems and conditions.
  - 4) A physician is not only a medical doctor of the near life preterm infants, they are also an advocator for the Right of Life concept, for caring and serving to them.
- e) <u>Physician act grounding on the evidences.</u> Thus, for preterm infants, the balancing and obtaining physiological status, immediate and emergency care be performed, before developing the evidences.
  - The education of a physician is for solving and overcome the healthy problems; thus, the main effort is for being at humanity and respect to them, their life. The main concept is balancing the tissue system, protecting occurring the pathology, especially hard for the near life preterm infants.
  - 2) For medical decision, evidences be scientifically evaluated, thus, the functional essential be given, without any hesitations.
  - 3) At the medical applications, the reaction of the preterm infant be also considered, side effects, advers effect must be considered for protection of reaction.
  - 4) The proceeding of death, mostly, by disturbing the tissue systems, thus, physician must evaluate the effectivity and efficiency at the medical approach, why not shielded form occurring the pathology, destruction of organ systems.
  - 5) Behind the medical applications, undone, not performed be also evaluated for arguing and discussion at scientific evaluation. Groundings and references be for educative and progression of the procedures.
  - 6) At multiway arguing, interrogation, the caring and protecting, avoiding procedures, before the pathology occurred be spontaneously be on action, even by the medical staff. This means an educational purpose.
  - 7) Precautions are not by fearing; thus, it will be reduced to be in active state. Willingly and desired to perform is the best method, for interrogation what is right and ought to do in philosophy.

# **11.** Life is going by the synchronization of tissue systems by coordination and cooperation

- a) As social person, as a Human being, brotherhood be our together with.
  - 1) Health preterm means all the tissue systems and body organism be functions altogether in advance and properly with cooperation together.
  - 2) An expert opining, consultation only be taken from Neonatology Professions. Thus the main educator is the case, the preterm infant. Close cooperation with the case and informative and experienced one be in close responsibility to take.
  - 3) Being together, sharing by science, is utmost important. Education is therefore not to be the first, by learning considered the other person experiment and case report evidences.

- b) Each person has a superiority, no one is same. Progression at science, increase the perceives, awarding the situation and condition, individual contributions, by decisions and sharing the experience is the progress going on it.
  - 1) No physician be in order of knowledge. They take only advices and for concerning, thus, everyone be special and unique not be same, so special medical act be done especially to each preterm infant.
  - 2) Physician be take continuously advices, consultations, thus, responsibility be at him/her, thus, sharing it with intensive care unit staffs. Information and consent does not require of preterm infant life, education and cooperation for this common, medical staff.
  - 3) For academic meeting, taking and giving knowledges and expert, profession. For evaluating the medical science, and for progression. Not giving lessons and education, cooperative fact must be the main attitude.
  - 4) Consultation for togetherness and joint meeting, sharing the professional experience be the aim, at regular special time for discussion, thus required preparation and assessment of the literature.
- c) At living organisms, all the tissue systems be in connection and relating by functions and influences at their functions.
  - 1) Comparison is an effective configuration of the tissue systems; thus, the individual finding be comparative with the other functions at the same body of the preterm.
  - 2) Thoughts and evidence based, Neonatology profession and experienced physician, as considering each preterm as an educator, likes to take care, and serve them with love and confidently in medicine.
  - 3) The tissue systems are confused and together in action, so, by considering all, at healthy configuration, medicine be cover all in physiological bases.

**12.** At the progress at Civilization, being by the positive, future differentiation and evaluative process by education.

- a) <u>Civilization can be by science and cumulation by education and progressive, evaluative and improving of the establishing perspective.</u>
  - At the Child Right Declaration, education is indicated as; "a) *concerning the child as a free at the community, active as an adult, preparing for outcome as such, respect their values*" b) *"the individual personality and physical and cognitive capabilities be process and be advanced*" like breastfeeding at the preterm, Thus the satisfaction at the nutritional state, independency as starting at birth even at the preterm infants.
  - 2) Improvement, advancement and even evaluative and varying to positive way, be required progress. Patients the subjects of educational concept for advancing at the education and profession.
- b) <u>Civilization be only by on purpose education for future cultural condition, also for preterm</u> infants, for survive and be in life.
  - Education, after medical faculty graduation is continuous, by the patients, especially the pre-viable preterm infants be educated greatly for new medical approaches, mostly be required.
  - 2) Physiological necessity, according the gestational age, protected from pathological conditions be accruing, great effort is essential, thus great educative concept,
- c) For medical attitude, using the mind on medical science, and be on empathy for the preterm infant evidences, individually physiological condition.
  - 1) Apart of the physiological needs, to be alive, for medical emergency advancing, thinking twice, arguing the evidences be critical, for the protection from harm, and the effective and efficient parameters thus, together with side and advers consideration be at valuation, calculation.

- 2) The life even for the physician be advancing and positively be changing in positive way, by medical science and also by ethically.
- 3) Past is forming the future; thus, education be also for the ready to overcome the new situations, contribute to a physician in progressive way.
- 4) If there is a contradictory evaluation, not making as a wrong one, thus be differentiation of the looking perspective, thus, if not on human rights and individual Right to Life, not be in consideration, be away of such thoughts.
- 5) After the medical procedures be done, it must be broadly be discussed by the physician and more advice or discussion be taken for the considerations.
- 6) Medical science be developed and progress by case and case reports, from conformation statistical researches. If done same as regulated by the list, no advancing be noticed.
- 7) Today is the result of yesterday, thus, next day be todays results that we are performing.
- 8) From past to future, education must have a great contribution for progressing in positively, for contribution a physician for himself/herself. The references be a brick for the new development concept.
- d) The purpose of and method of the education at the physician, continuous education, each by patient to patient, each condition and situation be a lesson, positive or negative way.
  - 1) For life balancing of the organ system is essential, thus, near life preterm infants cannot regulate this aspect, so, supportive medical procedures, as a matter of life.
  - 2) The physician education from treatment is turned to heat care for health situations and avoiding form pathology confirmed, early diagnosis and pre-treatment concept is being at the leading as primary.
  - 3) The education system at medicine is continuing education by himself/herself, by consultation, joint meeting and case-based education for scientific progress.
- e) For medical applications, be on science and open mind, precious perception, awareness of the individual condition and medical situation es obviously essential.
  - 1) Perceiving and conscious of the problems to be encountered, be the leading for profession.
  - A single evidence be change all the medical applications, so, be in conscious at the Intensive Care of the Neonatology Unit. One sign is in cooperation of the whole-body systems.
  - 3) Each findings, evidences be evaluated by mind, and be medically on scientific evaluation be in consideration for application. The laboratory estimations must answered as, why the parameter is taken, what is the expected and noticed the result be compromised at the case perspective.
  - 4) The evaluation as normal is not a meaningful consideration for evidences, as laboratory results. Balancing is keeping at the needed levels, so this is the desired result for the medical procedures.
  - 5) We are look like same, thus individually have specific tissue systems and reactions are obviously varies. This variation is profound at the near life preterm infants, thus even the body birth weight is same.
  - 6) Our body is in combination of the gravity, so be united, so, like scientific tissue system requirements be preciously be in considering for the medical approach, leading the action by this profound complex.
  - 7) Perceiving the righteous evidence of a physician, not continue wht is going to do, immediately change, completely diverged the treatment, according the preterm infant, even the knowledge is against it.
  - 8) Using the mind, indicates escaping from harm, and thoughts for better health, meaning balancing the requirements grounding on physiological demands. The medical act is the ethical action on science by evidence-based.

- 9) Each small details will be vital important for near life preterm infants at time to distinguished.
- 10) A physician is not a ruler obedience; thus, the knowledge only be guideline and advices, thus, differs as the individual demands and special conditions and findings, and be on evidence based, physiological backgrounds.

## 13. The truth and reality is at the obvious concrete evidences

- a) The reality, truth is as it is, objective, if personal evaluation then be an abstract.
  - 1) Thought the born of Sun at the east, setting at the west, the reality is not as seen, the World is turning around the Sun. To be on science and appearance will be differs, thus the reality on the truth, on science.
  - 2) Each concept diverse by individual, subjective matters.
  - 3) Near life preterm infant is the family in contradictory ideas, feelings. One side be a living, the other side be healthy, not have any problems or conditional state. The legal and ethical reality is living organism has Right to live, and we respect them, all the concept be for their health for survive and live. No decision for ending life is legal and ethical and family, physician has no right for discussion, it's a crime.
  - 4) Trisomy 21, Down Syndrome, up to 20 gestational week be ended, discharged, by the family consent. Thus, afterwards, common must care and serve for the infant, and also educated him/her. Without any other congenital abnormalities, the education may be satisfactory.
- b) Not any medical approach and procedures be done, by subjective feelings, attitudes. The evidences must evaluate under medical science, if not at his point, not be on physician act.
  - 1) For the evaluation perspective, only scientific looking is legal and ethical. The community, the traditional perspectives be only tor the Marital Law, thus, not valuable at the Crime law. So, from Constitution and Punishment Law, there is only one way for the discussion, science on evidence-based medicine.
  - 2) The main medical approach is by considering the physiology of the preterm, protecting from pathological outcome. Tissue and organ system cooperative functioning will be the expected one.
  - 3) The obtained results be only a contribution, not repeated for the other preterm. The importance is the philosophy of the aim and medical approach as a medical justice, give what is desired and have to do, at the preterm infant.
  - 4) Individual, egocentric and personal demands, leads even counter the creation, being as a creator, giving orders and rules, as if it will be happening.
  - 5) Physician be objective on science and by making empathy, and be on cooperative work, especially by Neonatology Intensive Care nurses.
- c) <u>By looking, concerning true or false, the decision be on data, not at the written knowledge.</u> <u>A medical approach, procedures, be by the preterm infants evidences, for care, serve and treatment, precautions and continuous vital follow up results.</u>
  - 1) Whether it is wright or wrong, consider the case, not the before information, as medical approach and treatment be on the case fundamentals of evidences, not to be harm, be care and serve the natural functions.
  - 2) Technology in detailed of science, so, principles and humanity and medical care and serve be on the outmost technological equipment, and modern ethical concepts.
  - 3) All the philosophies and thoughts be constructed on humanity and individual rights, mainly on Right to life. There will be no decision and ending argument at life. No one knows the future, so, be active on the creation.

- d) Even their opposition, physician educated for saying the truth. At medical procedures, if not wanted effects, and side, unexpected results be occurred, even protecting to be, for care not saving as secret, confidential is unhuman and increase the crime and punishment.
  - Physician first indicated the evidence, without any comment. Even it seems against to his/her approach, if on medical science and for physiology configurations, the progress be on their side, like consideration as complications. Complication iss inevitable reaction, although taken full care on precautions.
  - 2) Medical Records are especially at the legal issues so important, the reasoning and grounding at the progressive medication. Not indicated after the accusation.

#### 14. Evaluation at the performed and also not done ones.

- a) The aiming and reaching the result ve evaluated, even it is what to anticipate, thus for productive and enchaining at positive way.
  - 1) By giving the essential is not solving the problem. Thus, the preterm infant requirement is huge; in total volume, protein, calories and etc. so, giving them cannot be metabolized and be other complications as NEC. Not any pressure and obligations to give is for life, so, this is a walking on the street and be on rope at windy climate.
  - 2) Continuous follow up the tissue systems and metabolism, is for the evaluation of the physiology considering is vital important.
- b) <u>The evidences be as it is, thus, evaluations be on personal ideas, at scientific bases. Even not personal benefit, ideas are respectable, distinctive their thoughts, philosophies, and if not harm to private, regard the opinions.</u>
  - 1) Evidences be as it is, the evaluations be individual perspective, medical ones first give, by clinical condition.
  - 2) In some measurements, Gr is grain 2,2grams, so, the symbol is g, not gm or gr. Thus the reality is what it is as measured one.
  - 3) Sufficiency according to patient, requirement mostly continuously at effective and indicating the reality measurement.
  - 4) If the evidence be diverted subjectively or try to put standard model, as indicated at books, not to be on fact, not placing the preterm as the core of the case, so, if not be alter entirely, not be on the way of truth, not be a Neonatologist.
  - 5) What is the truth, measurement findings be not exact indication of the fact. Sterile is not meaning of sterile, not cultivated be an estimation. Some ideas be in thoughts, thus, not be on harm, be care and serve the preterm.
  - 6) Life and living status by clinical evidences, be at emergency state at preterm infant, caring and serving be done without any hesitation. A slight indication be an indication of life saving.
  - 7) Physician decision is not court order, due to the preterm findings and obtained facts, be required different way to go, not at harm too.
- c) The result is not on statistics, future outcome be not known, just can be estimated before. Each conditions, situations and state has special result as each preterm is unique and specific, not be a copying of others, statistics are at general, so they are unique warriors, and no one realizes the upcoming.
  - 1) No evidence be indicating the future outcome. Each condition and situation is specific depending the case, patient, thus, the positive expectations will not ended, forward in case of living.
  - 2) Each medical application and treatment will have a result, thus, without any effort, just survey what is happened, is not a physician's role, precautions be the expected action.
  - 3) Treatment is not what to be done, first not allow to be the problem establishing, and serving caring to be healthy is more effective and efficient than therapy.

- 4) The approaching to the therapy not for the result, thus, for the evidence-based reality, for preterm infant, caring and serving for healthy is the main concept at growth and development. If not allow to growth of pathogenic flora, so probiotics as a normal flora establishing is the fact have to be done.
- 5) The aim of living ve for the new generations. Exact healthy and non-problem generation is illegal dreams, this kind of application as clean society, racism is crime.
- 6) For effective and efficient at tissue systems, to be exact functional state of the case, thus the evaluation is complete in every manner, at the preterm infant.
- 7) Even a physician does not know the future, just some estimation of the medical disease and results, thus, just an assessment. So each case is special outcome.
- The serve and care is not at the requirements, also, for doses, the applicational way, medical procedures also.
- d) Science must depend on evidences, and reality findings.
  - 1) All the medical results are some scientific explanation, thus ve case and condition specific, so continuous evaluation is vital important.
  - 2) The body functions are immature as immune system, so infection arose, thus, antibiotics are not safe from infection and protection, so, cause several harm effects, like NEC, physiological flora must be confirmed.
  - 3) Continuous follow up is the essential requirement at Intensive Care Unit of Neonatology. Effects and reflection be immediately be evaluate upon this evidences.
- e) The evidences must be evaluated by the purpose, aim of the medication, is not to reach the target on the intent to reach, the rational fact to establishing the physiology consequence.
  - 1) All the scientific evidences are real and truth, considering as opposite thoughts has no meaning, the truth is at the case.
  - 2) All the thoughts be on positive perspective. Negative is indicates the death, so, protection and saving is the aim. Why, when, where and for whom is in general asking questions, so, thought to be based like that. Continuing care and serve for organ systems therefore vital important at preterm infants.
  - 3) The gaining is science, by ethical principles, thus, physician is an advocate, for the Right of Life, even for preterm infants.
  - 4) Healthy, continuing the life, by scientific perspectives. Statistical result is not indicates the case. The basic one, for healthy, precautions and essential medical status ve confirm, at the preterm infants.
  - 5) Nurse must to not the physicians order, thus, the one who the preterm is gives the permission.
  - 6) The reality is what is seen, not the estimated aspect. Why not done, in place of why not occurred, without accusing the preterm.
  - 7) *I give the order, that will be beneficence to preterm* is not what Neonatology profession mentioned. A vomiting will change all the program.
  - 8) Demands be same as the targeting factors, not be a collapsed building by the dream. Right the life a preterm, for serving, caring is not an abstract fact, this in medicine is objective actions on scientific perspective by special scientific perspective of preterm, not to cause any harm.
  - 9) Medical reasoning be on and for the preterm infant, thus, time and moment in time is vital important. So, not be on expectations and dreams, be on precautions and on the truth for balancing the organ systems.
  - 10) Physicians must be sure that, the realty be at the patient, true and righteous can only be learn from the preterm infant. Each value is specific to the patient, not be copy, may be similar thus, not the same.

- 11) Evidences be on truth and real, thus evaluations be free from professional aspect, thus all be on science, and on scientific way.
- 12) All evidences be on truth, real case, the evaluation be form scientific perspective, not any wrong leading hopeless decision, just meaning to fight the problem, try to solve it.

## Conclusion

Right to Life concept, nothing be on consideration for ending and taken it, no grounding, no reasoning for it, as legal and ethical principles.

At the Turkish Deontological Principles, *The main duty of a physician is performing, for human health, for human life, for the personality, utmost care and respect.* At the evidence-based medicine; Group A- Perform-By systemic evaluation, at Group B- Performing is suitable- By controlled studies, at Group C-Personal facts be on consideration-Case reports, at Group D-Discussion cases-establishing the harm at applications, Group E-Consultation-Only advices given not responsible at the act.

Physician role at the individual conditions, also mentioned at the Turkish Deontological Principles, as have being effective, at specific and discussable ones. As indicates like "The known medical applications and treatment, if not get satisfactory and contented healthy result is understood, the physician, by informative consent, under medical scientific methods, some experimental and for treatment approach, no criminal responsibility be encountered ". This main perspective restore and care of the physiological status, precautions for the problems that will be encountered, even estimated conditions be on and for healthy status, before the disease, condition be happened. The physician if he/she is even late at these facts, by law, "the medical person, who is late on, will be punished". The guilt be for personal responsibility, no one will be punished from others fault. Even at multi-personal acts, the individual only be responsibility form their situation, condition, responsibility. The disparity of the roles; as physician from medical, nurse from medical applications, pharmacy from the given drugs etc. The punishment degree is upon the lack of the act. As a leader of the team, physician is not at force, obligatory to them, thus, be medical science, be explain and be reasoning and grounding the case, preterm with the state. If there is not indicated at law, no punishment be given to a person. The administrative rules are not a reasoning for penalty, no comparison, no traditions and other evaluations can be noticed as crime. It must be remembered that, the main approach of the physician is for the case, patient, and for the family and common, the rights, the liberties and other person, at humanity and respect of the honor at the preterm infant.

As a result conclusion; the purpose, the aim of Physician medical approach is; at the protection of health concept, especially near vitality preterm infants, be support themselves physiological condition, situation, serving and protect form side effects before performing and precious care and attention, and early diagnosis of the disease or side effects, before physio-pathological evidence is obscure. This Declaration is for supportive at the approach at these values.

A physician is a medical doctor of not only common, thus, the rare and distinguished person, in humanity act, also.
