

*Research article/Araştırma makalesi***Flora of gypsumiferous and marl soils in Eskisehir (Turkey)**Derviş ÖZTÜRK<sup>\*1</sup>, Okan SEZER<sup>1</sup>, Onur KOYUNCU<sup>1</sup>, Atila OCAK<sup>1</sup><sup>1</sup> Biology Department, Art and Science Faculty, Eskisehir Osmangazi University, 26480, Meşelik, Eskisehir-Turkey**Abstract**

The investigation area covers areas with gypsum and marl soils located within the borders of Eskisehir. According to Davis' squaring system, a large part of the research area is located on the B3 surface. 1750 samples were collected from the research area between 2012 and 2015 for the determination of florae. The APG III system was monitored while preparing the floristic list. As a result of the diagnoses made; 354 genus belonging to 72 families, 673 species and total 738 taxa were identified. Of the plant samples that were diagnosed, 738 taxa belong to the Spermatophyta divisosus. 42% (5,6%) of the total taxa in the area are Mediterranean, 152 (20.6%) Iranian-Turanian, 38 (5.1%) Euro-Siberian element, 27 (3.6%) E. Mediterranean elements and 478 (64.7%) are multi-regional or phytogeographic regions of unknown taxa. 129 (17.5%) endemic taxa were found in the research area.

**Eskişehir'deki jipsli ve marnlı toprakların florası****Özet**

Araştırma alanı Eskisehir sınırları içerisinde yer alan jipsli ve marnlı toprakların bulunduğu alanları kapsamaktadır. Davis'in kareleme sisteme göre araştırma alanının büyük bir bölümü B3 karesinde yer almaktadır. Floranın belirlenmesi için 2012-2015 yılları arasında araştırma alanından 1750 örnek toplanmıştır. Floristik liste hazırlanırken APG III sistemi izlenmiştir. Yapılan teşhisler sonucunda; 72 familyaya ait 354 cins, 673 tür ve toplam 738 takson tespit edilmiştir. Teşhisini yapılan bitki örneklerinden 738 takson Spermatophyta divizyonuna aittir. Alandaki toplam taksonların 42'si (% 5.6) Akdeniz elementi, 152'si (% 20.6) İran-Turan elementi, 38'i (% 5.1) Avrupa-Sibirya elementi, 27'si (% 3.6) D. Akdeniz elementi ve 478'i (% 64.7) çok bölgeli veya fitocoğrafik bölgesi bilinmeyen taksonlardır. Araştırma alanında 129 (% 17.5) endemik takson bulunmaktadır.

**Anahtar kelimeler:** B3 karesi, Eskisehir, jips, marn, flora**1. Introduction**

The Study area is located in Eskisehir in the Northwest Central Anatolian Region between 29°58' and 32°04' Eastern longitudes and 39°06' and 40°09' Northern latitudes. According to the Grid System set by P. H. Davis (1965) for Eskisehir province, a large part is located in B3, a small part in south-east is located in B4, and a small part in north is located within A3 square (Figure 1). According to this system, The study area is within the square of B3. The study area Eskisehir is neighboring Bolu in the north, Ankara in the east, Afyon and Konya in the south, Kütahya in the west and Bilecik in the northwest (Report, 2011).

Gypsum is a mineral and its chemical composition is calcium sulfate. The type whose compound has two molecules of crystal water is called gypsum ( $\text{CaSO}_4 + 2\text{H}_2\text{O}$ ) (Özdeniz et al., 2016). It is a mixture consisting naturally of marn, clay and calcium carbonate at various proportions (Akpolat and Celik, 2005). When the amount of calcium carbonate is more than clay, it is called limestone. Gypsiferous and gypsiferous-marn type bedrocks are very suitable for the settlement of endemic species (Akman et al., 2014).

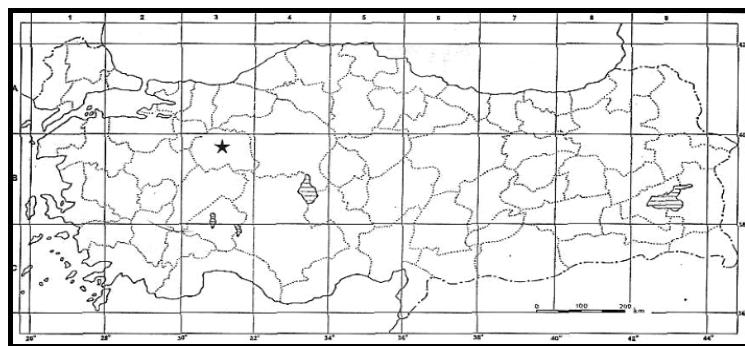

Figure 1. The Map of Turkey according to the Grid System of P. H. Davis (1965)

Gypsum outcrops are widely distributed globally and strongly affect the flora that grows on them. In fact, many plant species only grow on this type of rock (García, F.J.P., et all. 2018). Gypsum soils show a suite of chemical and physical properties that render them particularly restrictive for plant life (Bolukbasi et al., 2016).

This study was conducted to emphasize the importance of edaphic and geological isolation in terms of floristic diversity and endemism. Some of the important reasons of floristic diversity of Turkey are the intense endemism that develops from edaphic and geological rocks; and is explained by the term “geological island”; and such areas are called “geological island” or “edaphic island”. The main factors affecting the diversity of the species in the areas where gypsophila live are electrical conductivity, soil pH and soil anion and cation concentrations (Smith, H. W., & Weldon, M. D., 1941). These factors also determine the degree of influence of the biotic factors (Akman et al., 2014). In the context of the study, gypsiferous soils in Eskişehir and the vegetation cover, species diversity and ecological effects were determined (Türe, C. 2000). In the present study, the aim is to complete the lack of literature data on gypsiferous soils and plant cover in Eskişehir. It has been determined that some local floristic studies have been conducted around the study area (Özaydın and Yücel, 2004; Umay and Uğurlu, 2010; Özgiş et al., 2015).

Figure 2. Study area map

## 2. Materials and methods

In the study area, a total of 1750 samples were collected from 56 different fields which coincided with the vegetation period in all seasons of the year between 2012 and 2015. It was cared to collect at least three samples for each species together with organs like roots, leaves, flowers and fruits as much as possible. The localities of the samples collected in the field work were identified with the Garmin GPS device and the photographs were taken with Canon D5300 brand camera. The samples that were collected were pressed and dried in line with the relevant rules (Seçmen et al., 2004). The stations where the samples were collected were numbered and the altitude, locality, habitat, date, and latitude-longitude coordinates (GPS) of the area were noted in the land register. Although the determination of the samples was made on materials that were not dried during field works, it was mostly made on the materials dried in the laboratory environment. Olympus brand binocular stereo microscopes were used during the diagnoses. Several studies were made use of during the diagnoses of the plants that were collected like the Flora of Turkey and the East Aegean Islands (Davis, 1965-1988), Flora Europeae (Tutin, 1965-1980), Flora Palaestina Vol. I-II (Zohary, 1966-1987), Flora Palaestina Vol. III-IV (Freibrun-Dothan, 1977-1986), Ankara City Flora (Erik, S. 1993), List of Turkey Plants (Vascular Plants) (Güner et al., 2012). Eskişehir Osmangazi University (OUFE) herbarium was used in the diagnosis of some of the collected samples which were difficult to control and name. In some of the samples that were difficult to

diagnose, experts of the area were consulted. After the naming, all the samples that were made into herbarium material were placed in the Herbarium Center of the Eskişehir Osmangazi University Science and Literature Faculty (OUFE).

When the floristic findings were given, they were based on APG III, and the families were arranged in accordance with the evolutionary sequence given in the “Linear Angiosperm Phylogeny Group (APG III): A Linear Sequence of the Families in APG III” (Haston et al., 2009). Since there is no evolutionary classification made according to the APG System in terms of genus, species and subspecies, the subfamily categories were listed in alphabetical order. In writing the floristic list, the names of the family and species and the subspecies taxon names were written in bold and italic (Yeşilyurt et al., 2008). The locality data of the taxa whose localities were given in front of the floristic list were numbered in box brackets. The endemism status of the species, the defined phytogeographical regions and the collective numbers were also given.

### 3. Results

A total of 56 days of field work was carried out in the study area from March 2012 to October 2015. As a result of the field work, 1750 samples were collected; and as the result of the diagnoses, it was determined that there were 354 genera of 72 families and 738 species and subspecies taxa of these species. Of the families identified, 69 were Angiosperm, 3 were Gymnosperm, and 60 of the Angiosperm were dicotyl 9, which is Monocotyledon. 351 of the species are Angiosperm, 3 are Gymnosperm. 329 of the species are dicotyledonous, 22 are monocotyledonous. Of the identified taxa, 152 belong to Iranian Turan, 42 to Mediterranean, 27 to E. Mediterranean, 38 to Siberia and 1 to Black Sea phytogeographical regions and 478 to phytogeographical regions are unknown or very regional (Table 3). Up to now 129 endemic taxa have been identified in the region and the endemism rate is approximately 17.5%. 4 of endemic taxa are in EN, 3 in VU, 1 in CR, 3 in NT and 36 in LC category.

### 3.1. The Localities List

#### 3.1.1. The Localities where the plants were collected

The entire study area is located within the borders of Eskişehir province; and is in the A3 and B3 square according to the squaring system of Davis (Figure 1.)

- L1. Eskişehir City Center; Musaözü Surroundings Opposite Riding Club, N 39°43'30.64"- E 030°20'38.33", 892 m.
- L2. Eskişehir City Center; Between Musaözü-Takmak, N 39°41'59.93"- E 030°22'3.67", 895 m.
- L3. Eskişehir City Center; Yenisoğça Outlet, Inside The Forest, N 39°36'32.94"- E 030°22'0.11", 875 m.
- L4. Eskişehir City Center; Yenisoğça Water Tank, N 39°37'51.62"- E 030°21'54.70", 880 m.
- L5. Eskişehir City Center; Yörük Akçayır Neighborhood Surroundings, N 39°43'37.08"- E 030°20'49.19", 882 m.
- L6. Eskişehir City Center; Takmak Village Road Turning, White Soils, N 39°43'20.23"- E 030°20'39.71", 894 m.
- L7. Eskişehir City Center; Gülpınar Surroundings, N 39°42'21.54"- E 030°35'27.82", 891 m.
- L8. Alpu; Bozan Afforestation Field, N 39°47'54.6"- E 31°07'16.4"; 885 m.
- L9. Alpu; Bozan Afforestation Field, Eastern Slope, N 39°47'41.7"- E 31°08'01.6"; 890 m.
- L10. Alpu; Bozan Afforestation Field, Southern Slope, N 39°47'44.2"- E 31°06'18.1"; 903 m.
- L11. Alpu; Bozan Afforestation Field, Southern-Eastern Slope, N 39°48'31.6"- E 31°07'06.5"; 925 m.
- L12. Alpu; Bozan Afforestation Field, Northern Slope, N 39°48'14.6"- E 31°07'29.6"; 927 m.
- L13. Alpu; Bozan Afforestation Field, Southern Western Slope, N 39°47'55.1"- E 31°07'23.4"; 845 m.
- L14. Alpu; Bozan Afforestation Field, Western Slope, N 39°48'10.1"- E 31°06'37.7"; 924 m.
- L15. Alpu; Bozan; N 39°48'34.07"- E 31°8'46.64", 788 m.
- L15. Alpu; Alapınar Village Forest Area, N 40°00'52.42"- E 030°50'42.69", 1093 m.
- L16. Alpu; Bozan Afforestation Field, N 39°47'40.99"- E 031°06'18.20", 891 m.
- L17. Alpu; Bozan Afforestation Field, N 39°47'45.94"- E 031°06'41.12", 842 m.
- L18. Alpu; Bozan Afforestation Field, N 39°48'9.78"- E 031°06'35.5"; 916 m.
- L19. Alpu; Bozan Road Left Hills, N 39°48'15.26"- E 031°04'37.30", 843 m.
- L20. Alpu; Bozan Road Left Hills, N 39°48'9.111"- E 031°03'38.75", 829 m.
- L21. Alpu; Bozan Road Left Hills, N 39°48'9.111"- E 031°03'38.75", 829 m.
- L22. Alpu; Bozan Afforestation Field, N 39°47'58.06"- E 031°06'2.109", 897 m.

- L23. Alpu; Bozan Afforestation Field, N 39°48'27.77"- E 031°06'39.75", 919 m.
- L24. Alpu; Bozan Afforestation Field, N 39°48'19.58"- E 031°07'26.68", 926 m.
- L25. Alpu; Mihalıçık Road Bozan Road Junction, Bozan Opposite Slopes, N 39°49'2.440"- E 031°05'15.74", 858 m.
- L26. Beylikova; Aşağıdoğanoğlu Road Junction, N 39°49'28.01"- E 031°10'20.89", 858 m.
- L27. Beylikova; Aşağıdoğanoğlu Village Forest Area Road Surroundings, N 39°51'19.49"- E 031°11'43", 939 m.
- L28. Beylikova; Between Aşağıdoğanoğlu-Yukarıdoğanoğlu, Forest Area Road, N 39°52'40.90"- E 031°12'57.13", 1026 m.
- L29. Beylikova; Aşağı Dudaş Village Surroundings, N 39°50'22"- E 031°13'55.00", 926 m.

The richest families in terms of number of species and underground taxa are given in Table 1. In terms of number of species and subspecies, 98 (% 13,29) species and subspecies taxa and Asteraceae family are the first order. Later on, Brassicaceae 70 (9.49%), Fabaceae 68 (9.22%), Lamiaceae 47 (6.73%), Poaceae 44 (5.97%), Caryophyllaceae 40 (3,66%), Boraginaceae 24 (3,25%), Ranunculaceae 19 (2,57%), Asparagaceae 19 (2,57%), Amaranthaceae 17 (2,30%), Papaveraceae 17, Plantaginaceae 16 (2,17%), Rosaceae 14 (1,89%), Euphorbiaceae 13 (1,76%) and others 283 (38,26%) were identified as taxa and species (Table 1.).

Table 1. The richest families in research

No	Family Name	Number of Species	Rate (%)
1	Asteraceae	98	13,29
2	Brassicaceae	70	9,49
3	Fabaceae	68	9,22
4	Lamiaceae	47	6,73
5	Poaceae	44	5,97
6	Caryophyllaceae	40	5,42
7	Apiaceae	27	3,66
8	Boraginaceae	24	3,25
9	Ranunculaceae	19	2,57
10	Asparagaceae	19	2,57
11	Amaranthaceae	17	2,30
12	Papaveraceae	17	2,30
13	Plantaginaceae	16	2,17
14	Rosaceae	14	1,89
15	Euphorbiaceae	13	1,76
16	Others	282	38,26
	Total	738	100

In terms of species and subspecies number of taxa, the first order is the order of 19 species and the subspecies taxa and Astragalus. *Allium* (14 spp.), *Salvia* and *Centaurea* (13 spp.) , *Alyssum* and *Euphorbia* (12 spp.) , *Ornithogalum* (9 spp.), *Convolvulus* and *Silene* (8 spp.), *Achillea*, *Aethionema*, *Medicago*, *Papaver*, *Veronica* (7 spp.), *Bupleurum*, *Crocus*, *Gagea*,

*Gypsophila*, *Orobanche*, *Scorzonera* (6 spp.), *Anthemis*, *Consolida*, *Dianthus*, *Hypericum*, *Scabiosa*, *Trifolium*, *Verbascum* (5 spp.), 484 species and subspecies were identified as taxa, while *Acantholimon*, *Bromus*, *Colchicum*, *Genista*, *Linaria*, *Nepeta*, *Onobrychis*, *Onosma*, *Poa*, *Ranunculus*, *Rosa*, *Scutellaria*, *Thlaspi*, *Tragopogon* (4 spp.) (Table 2).

Table 2. The richest species in the study area.

No	Genera	Number of Species	Rate (%)
1	<i>Astragalus</i>	19	2,57
2	<i>Allium</i>	14	1,89
3	<i>Centaurea</i> , <i>Salvia</i>	13	1,76
4	<i>Alyssum</i> , <i>Euphorbia</i>	12	1,62
5	<i>Ornithogalum</i>	9	1,22
6	<i>Convolvulus</i> , <i>Silene</i>	8	1,08
7	<i>Achillea</i> , <i>Aethionema</i> , <i>Medicago</i> , <i>Papaver</i> , <i>Veronica</i>	7	0,94
8	<i>Bupleurum</i> , <i>Crocus</i> , <i>Gagea</i> , <i>Gypsophila</i> , <i>Orobanche</i> , <i>Scorzonera</i>	6	0,81
9	<i>Anthemis</i> , <i>Trifolium</i> , <i>Consolida</i> , <i>Verbascum</i> , <i>Dianthus</i> , <i>Hypericum</i> , <i>Scabiosa</i>	5	0,67
10	<i>Acantholimon</i> , <i>Bromus</i> , <i>Colchicum</i> , <i>Genista</i> , <i>Linaria</i> , <i>Nepeta</i> , <i>Onobrychis</i> , <i>Onosma</i> , <i>Poa</i> , <i>Ranunculus</i> , <i>Rosa</i> , <i>Scutellaria</i> , <i>Thlaspi</i> , <i>Tragopogon</i>	4	0,54
	Others	475	64,45
	Total	738	100

Out of the 243 species and subspecies taxa whose phytogeographic regions are already known, 152 (20,6%) species and subspecies taxa were Iran-Turan phytogeographical area elements, 42 (5,6%) species and subspecies taxa were Mediterranean phytogeographical area elements, 38 (5,1%) species and subspecies taxa were from Europe-Siberia phytogeographical area element, and 478 (64,7%) species and subspecies taxa were unknown phytogeographical areas or were multiareal (Table 3).

Table 3. Distribution of Species and Subalpine Taxa in Research Area by Phytogeographic Region.

Phytogeographic Region	Number of Species	Rate (%)
Iran-Turan	152	20,6
Mediterranean	42	5,6
E. Mediterranean	27	3,6
Euro-Siberian	38	5,1
Multi-Region or Unknown	478	64,7
Total	738	100

Out of the 738 species and subspecies taxa that were detected in our study area, 130 were endemic and the rate of endemism of these species and subspecies taxa was determined as 17.61%.

The distribution of the endemic and non-endemic species according to the danger class specified by the IUCN was determined by using the "Plants of Turkey Red Book" (Ekim et al., 2000). Out of the 137 endemic taxa in the Study Area, 6 were EN, 9 were VU, 4 were CR, 22 were NT and 97 were in LC category.

#### 4. Conclusions and discussion

According to the P. H. Davis's (1965) grid system, a large part of Eskişehir province is located in B3, a smaller part is located in south-east B4, and another smaller part is located in north part in A3 square. From March of 2012 to October of 2015, a total of 56 days' Field Study was conducted in the study area. As a result of the field studies, 1850 samples were collected and 354 genera of 72 families and 738 species and subspecies taxa of these species were identified in the diagnoses. Specified species were compared to those reported in similar studies conducted in the previous years near the study area.

The Asteraceae family ranked the first in terms of the number of taxa it possesses in the study area and in other studies conducted around the study area. Asteraceae family is the world's and Turkey's largest family, and the result is natural. The Brassicaceae, which ranks the second in terms of the taxa it has in the flora of Turkey (Yücel et al., 2010). When the ranks of the other families were examined, it was determined that they show approximately parallel family ranking in the flora of Turkey. The reason why Scrophulariaceae, which is important for the flora of Turkey, was not included in the list was due to the fact that the taxon list was prepared as based on the APG III system.

The taxonomic location of many genera, species and subspecies has changed in the APG III system. These results have caused that some families like Amaranthaceae that were normally not in the list among the first 10 were included in the list. All the previous studies compared in terms of location were in the same phytogeographical region with the study area. Parallel to this, in all studies, the richest phytogeographical region in terms of the number of the taxa is Iran-Turan elements. The Mediterranean Phytogeographical region ranks the second in terms of the number of the taxa; and the Euro-Siberian Phytogeographical region ranks the last in all previous studies.

When Astragalus is the first order, *Salvia*, *Silene*, *Centaurea*, *Allium* and *Alyssum* are followed by the most taxa-containing breeds found in the study. Turkey is *Astragalus* first place in the ranking of the Flora family that is in line with the results obtained from this study area. When investigated by other researches, *Salvia* took the first place and *Allium* was in the second place in the research field.

All of the 738 species and subspecies taxa determined in the study area were endemic and the endemism rate was 17.61%. This rate is lower than the 31.82% endemism rate in Turkey. The area that is the richest region in Turkey in terms of the phytogeographical region and the number of the endemic taxa is Iran and Turan phytogeographical area. The Mediterranean and Europe-Siberian phytogeographical area follow this area. In the light of the data received in the study area it is observed that this ranking, which depended on the endemism rate in Turkey, is similar to the findings.

Most of the step areas in the study area are used as agricultural areas especially if they are near the villages. Aside from these, the areas that are not suitable for agriculture and the surrounding areas are left open to grazing. In these unprotected areas, there is a defective vegetation. As a result of the cutting down of the trees (especially of the oaks) in order to burn at homes, forest formations were largely destroyed; and they are replaced by step formations where especially Astragalus dominated. There are no plant covers under the Astragalus groups, which reveals the extent of intense pressure and damage on the diversity of the species. Erdoğan (2011) and Türe (2002) conducted studies and made syntaxonomic and floristic analyses for the vegetation cover of Sivrihisar Mountains (Eskişehir); and mentioned about gypsicol step vegetation and flora in the area.

With the present study, the relationship between the gypsiferous and marn lands in Eskişehir and the vegetation cover has been determined; and the lack of data in the literature relevant to the vegetation cover and species diversity in this area has been resolved.
