Lichenized and lichenicolous fungi of Katırlı mountain in Bursa (Turkey) province

Züleyha DOĞRU¹, Şaban GÜVENÇ *¹

¹ Uludag University, Arts and Sciences Faculty, Biology Department, Bursa, Turkey

Abstract

In this study, 254 taxa were identified from 42 different localities at Katırlı mountain in the province of Bursa. Among of these, 36 taxa for Bursa and *Porpidia ochrolemma* (Vain.) Brodo & R. Sant. for Turkey are new records.

Key words: Lichen, biodiversity, Katırlı mountain, Bursa, Turkey

----- * -----

Bursa ilinde Katırlı dağlarının likenleşmiş ve likenikol mantarları

Özet

Bu çalışmada Bursa ilinde Katırlı dağındaki 42 farklı lokaliteden 254 takson tespit edilmiştir. Bu taksonlardan 36 tanesi Bursa için, *Porpidia ochrolemma* (Vain.) Brodo & R. Sant. Türkiye için yeni kayittır.

Anahtar kelimeler: Likenler, biyoçeşitlilik, Katırlı dağı, Bursa, Türkiye

1. Introduction

Bursa province is one of the most well studied provinces on the lichen diversity in Turkey. The first lichen records in Bursa province has started with 14 lichen species records given by Steiner (1916) at the beginning of the year of 1900. Many lichenized and lichenicolous fungi from Bursa province are gained as contribution to the lichen flora of Turkey (Doğru and Güvenç, 2007; Yazıcı, 2007; Yazıcı et al., 2007; Arslan et al., 2011; Oran, 2011; Oran and Öztürk, 2011, 2012). Numerous studies on lichens in the province of Bursa have been done in Uludag mountain (Öztürk, 1992; Güvenç and Öztürk, 2004; Töre and Öztürk, 2009), as the highest point of province, and the districts of Gemlik-Mudanya which located on the shores of Marmara sea (Özdemir and Öztürk, 1992; Öztürk, 1997; Oran and Öztürk, 2006), and Karacabey (Yazıcı, 1999) and Mustafakemalpaşa districts (Yazıcı and Aslan, 2006).

There are no studies on lichens in Katırlı mountain. Therefore, we aimed to contribute to the knowledge of the lichenized and lichenicolous fungi of Bursa province and Turkey.

2. Materials and methods

The lichen samples were collected from 42 localities in Katırlı mountain at the northeast of the province of Bursa between 04 June 2003 and 07 November 2004 (Fig. 1). The specimens were examined with a Leica EZ4 model stereomicroscope, and an Olympus CH-2 light microscope for external morphology and anatomical observations. Ascospore measurements were carried out in water. Identifications were determined according to the literatures (Smith et al., 2009; Wirth et al., 2013). The specimens were stored in BULU (Herbarium of Faculty of Sciences and Arts in the Uludag University, Bursa, Turkey).

2.1. The study area

Bursa province is located between 39°30'-40°37'N latitude and 28°06'-29°58'E longitude in the southeast of the Marmara region of Turkey. Bursa is usually dominated by Mediterranean climate, and also is a transition region

BioDiCon. 530-0316

between the Mediterranean climate and the Black Sea climate. Bursa province has a humid climate due to influence of the Mediterranean climate and is experienced a significant drought during the summer (Öztürk, 2010). According to meteorological data (1950-2014), the mean annual temperature in Bursa (at 155 m) is 14.6°C and the mean annual rainfall is 696,3 mm (Anonymous, 2015). Bursa plain is located to the south of the Marmara region. Plain is bordered in the south by Uludağ mountain (2543 m) which is the highest mountain of the Marmara region, and by the north Mudanya Mountains and Katırlı mountain.

The study area, Katırlı mountain, is the highest point (1283 m) after Uludağ mountain in Bursa. Katırlı mountain in the northeast of the province of Bursa is located between 40°14'-40°25' N and 29°05'-29°26' E. Katırlı mountain is surrounded by the districts of Orhangazi in the north, Gemlik in the northwest, Osmangazi in the southwest, Gürsu and Kestel in the south, and Yenişehir in the east. Katırlı mountain height ranges from 90 meters up to 1283 meters. The highest point of Katırlı mountain is Gürle hill (1283 m). Other important elevations are Kırbayır hill (1108 m), Mağazataşı hill (1011 m), Gedik hill (907 m), Üçkaya hill (846 m) and Yankaya hill (529 m) (Erdoğan et al., 2011).

3. Results

The taxa were listed in alphabetical order, followed by locality, substrate and herbarium number. An alphabetical list of taxa names was created based on the latest current names in Index Fungorum (<http://www.indexfungorum.org/names/names.asp>). Lichen taxa new to Turkey are indicated by (*), and new to Bursa province by (+).

(+) *Acarospora badiofuscata* (Nyl.) Th. Fr.

28: Siliceous rock (7600).

Acarospora cervina A. Massal.

12, 14, 16, 19, 32, 33, 37, 39: Calcareous rock (6116, 6995, 6818, 6875, 7047, 7152, 7191, 6551).

Acarospora macrospora (Hepp) A. Massal. ex Bagl.

42: Calcareous rock (BULU 6593).

(+) *Acarospora veronensis* A. Massal.

1: Siliceous rock (7293).

(+) *Acrocordia gemmata* (Ach.) A. Massal.

8: *Carpinus* sp. (6681); 29: *Fagus* sp. (7623); 30: *Populus* sp. (7115).

Amandinea punctata (Hoffm.) Coppins & Scheid.

1, 26, 32: Siliceous rock (7295, 7493, 7059); 8: *Carpinus* sp. (6666), and *Quercus* sp. (6673); 17: *Quercus* sp.

- (*) **Porpidia ochrolemma** (Vain.) Brodo & R. Sant.
This sorediate crustose lichen is characterized by having a smooth, ± continuous or rimose, creamy yellow to orange yellow gray, areolate thallus containing stictic acid (K + yellow, Pd + orange) and numerous round to irregular, tuberculate, grey-white soralia. *P. ochrolemma* is chemically similar to *P. soredizodes*, but *P. soredizodes* is distinguished by its much thinner, grey thallus with farinose to granular, often blue-grey or cream-coloured soredia. *P. ochrolemma* is known only from the British Isles, continental Europe and North America (Jablonska et al., 2011). This species grows on siliceous rock.

4. Conclusions and discussion

In this study, 254 taxa were identified from 42 different localities. Of these, 36 taxa were new for Bursa, and *Porpidia ochrolemma* (Vain.) Brodo & R. Sant. was new for Turkey. The most common genera with the species numbers in the study area were *Lecanora* (18), *Caloplaca* (12), *Physcia* (9), *Cladonia* and *Pertusaria* (8), *Rhizocarpon* and *Rinodina* (7), *Xanthoparmelia* (6), *Collerina*, *Lepraria*, *Peltigera*, *Ramalina*, *Usnea* and *Verrucaria* (5). The percentages of crustose, foliose, fruticose and squamulose type thallus growth forms of the total 254 taxa were 62.21%, 29.92%, 4.33% and 3.54 %, respectively.

The most common species with occurrence frequency were *Lecidella elaeochroma* (32), *Xanthoria parietina* (27), *Physcia adscendens* (26), *Lecanora subcarpinea* (25), *Protoparmeliopsis muralis* (24), *Evernia prunastri* (23), *Candelariella vitellina* (22), *Parmelia sulcata* (21), *Athallia holocarpa* (19), *Rinodina exigua* (18), *Lecanora carpinea* (17), *Aspicilia cinerea*, *A. radios* and *Cladonia pyxidata* (16), *Circinaria contorta*, *Lepraria lobificans* and *Rhizocarpon geographicum* (15), *Candelariella aurella*, *Pleurosticta acetabulum* and *Pseudevernia furfuracea* (L.) Zopf var. *furfuracea* (14), *Melanelia subaurifera* and *Pertusaria albescens* (13), *Lathagrium cristatum*, *Melanelia subargentifera*, *Physcia aipolia* and *Physconia enteroxantha* (12), *Hypogymnia physodes*, *Hypogymnia tubulosa*, *Lecanora argentata*, *Parmelina quericina*, *Parmelina tiliacea* and *Xanthoparmelia pulla* (11), *Blastenia crenularia* and *Diplotomma epipodium* (10).

62 taxa were identified on calcareous rock. Some of the common and characteristics species of calcareous rocks were *Acarospora cervina*, *Athallia holocarpa*, *Bagliettoa parmigera*, *Caloplaca chalybaea*, *C. lactea*, *Candelariella aurella*, *Circinaria calcarea*, *Diplotomma albovatrum*, *D. epipodium*, *Placocarpus schaeferi*, *Placynthium nigrum*, *Rinodina bischoffii*, *Sarcogyne regularis*, *Variospora aurantia*, *V. dolomiticola*, *V. flavescens* and *Verrucaria calciseda*. On the other hand, 64 taxa were identified on siliceous rock. Some of the common and characteristics species

of siliceous rocks were *Aspicilia cinerea*, *Blastenia crenularia*, *Candelariella vitellina*, *Diplotomma chlorophaeum*, *Lecidea fuscoatra*, *Lecidella carpathica*, *Porpidia macrocarpa*, *Rhizocarpon distinctum*, *Rh. geographicum*, *Tephromela atra*, *Xanthoparmelia conspersa*, *X. pulla*, *X. somloensis* and *X. tinctina*.

Determined lichenicolous species were *Caloplaca inconnexa* on the thallus of *Acarospora cervina*, *Flavoplaca oasis* on the thallus of *Bagliettoa parmigera*, *Flavoplaca polycarpa* on the thallus of *Verrucaria calciseda* and *Sphinctrina turbinata* on the thallus of *Pertusaria pertusa*.

A total of 78 species have been identified on oaks which is one of the most common trees in the study area. The most common species on *Quercus* sp. according to the number of localities, respectively, were *Lecidella elaeochroma* (14 localities), *Parmelia sulcata* (13), *Evernia prunastri* (12), *Lecanora chlarotera* and *L. subcarpinea* (9), *Parmelina quercina* (8), *P. tiliacea* (7), *Anaptychia ciliaris*, *Buellia disciformis*, *Melanelia subargentifera* and *Pertusaria albescens* (6).

So far, at 40 studies on lichen in the province of Bursa, a total of 447 taxa were identified (Fig. 2). The number of taxa was reached to 484 together with 37 new records for Bursa province in this study.
