The research area is situated in Milas district of Mugla province. In this study, during the period March 2009 - July 2010 727 plant specimens, 66 families, 197 genera, 335 specific and infraspecific taxa were collected and identified. Sixteen of the 335 taxa are new records for the C1 square. The number of endemic plants is 18 (5.37%). The distribution rates of the specimens into phytogeographical regions are as follows: Mediterranean elements 155 (46,26%), Irano-Turanian elements 6 (1,79%) and Euro-Siberian elements 7 (2,08%). Unknown or cosmopolits 167 (49,85%).

Key words: Labranda, Flora, Milas, Muğla, Turkey

Tarihi Labranda (Milas-Muğla) Kalıntıları ve Çevresinin Floristik Özellikleri**Özet**

Araştırma alanı Muğla ilinin Milas ilçesinde yer alır. Bu çalışmada, Mart 2009 – Temmuz 2010 yıllarında toplanan 727 bitki örneğinin değerlendirilmesi ile 66 familya, 197 cins, 335 tür ve türaltı takson tespit edilmiştir. 335 taksondan 16'sı C1 karesi için yeni kayıttır. Endemik bitkilerin sayısı 18 (% 5,37)'dir. Taksonların fitocoğrafik bölgelere dağılım oranları şu şekildedir: Akdeniz elementleri 155 (% 46,26), Iran-Turan elementleri 6 (% 1,79) ve Avrupa-Sibirya elementleri 7 (% 2,08). Geniş yayılışı ve yayılış alanları belli olmayan taksonların sayısı 167 (% 49,85).

Anahtar kelimeler: Labranda, Flora, Milas, Muğla, Türkiye**1. Introduction**

Turkey is a country rich in historical features. Espacially Anatolia has hosted many civilizations for centuries. The history of Labranda, which is located in southwestern Anatolia, dates back to the seventh century BC (Hellström, 2007). Labranda, unlike the historic areas around has been known as a sanctuary alone for centuries (Kızıl, 2002). Although there are lots of historic areas in the southwest of Anatolia, their floristic structure has not been studied profoundly. In the ancient city area, Aspat Castle (Strobilos) in Bodrum, Muğla province and the surrounding flora was studied by Çınar (Unpublished). Anamur Antique city and its surrounding has studied by Yıldıztugay and Küçüködük (Yıldıztugay and Küçüködük, 2010). Located in the town of Yatağan, Lagina and Stratoneika historical areas flora are still being studied by Department of Botany members at Pamukkale University. Here are some other studies done in the areas close to the research field: Yatağan Bencik Mountain flora (Aktepe and Varol, 2005), Flora of Yılaklı Mountain in the center of Muğla province (Varol et al, 2004), the flora of the region between Didim, Milas and Ören (Pirhan, 2003) and flora and vegetation of Beşparmak (West Menteşe) mountains (Aydın-Muğla) (Özel, 1992).

The purpose of this study is to be a source of the determination of the endemic plants and other floristic studies done in areas close to here in the future as well as to contribute.

1.1 Description of The Study Area

The study area is in the west-Anatolia region of Turkey. The study area is within the boundaries of the district of Milas in Muğla $27^{\circ} 49' 19''$ East longitude and $37^{\circ} 25' 15''$ North latitude. Labranda located 14 km. northeast of Milas surrounded by the villages of Ortaköy east, Sarıkaya west and southwest Kargıcak (Figure 1). The altitude of the area is between 580 m-750 m (Figure 2).

The meteorological climatic data were obtained from the General Directory of Meteorological Affairs (Anonymus, 2005). The study area has a Mediterranean climate, the main characteristics of which are: dry summers and warm and rainy winters. The seasonal precipitation regime during the year is as: Winter, autumn, spring and summer (Akman, 1982). In the research area, the annual mean temperature is 17.8°C . The maximum mean temperature is 24.5°C in August. The minimum mean temperature is 4.7°C in January. The average annual total rainfall is of 698.4 mm. Annual average humidity is ranged between 59.1- 62.2%. For the characterization of the climatic characteristics of the area, Emberger's pluviothermic quotient and Walter's ombrothermic diagrams (Walter, 1956) were used (Figure 3).

2. Materials and methods

The materials of this investigation are comprised plant specimens collected (Muğla- province) in the Labranda protected area and its surroundings between March 2009 and July 2010. The majority of the specimens were identified by using the Flora of Turkey and the East Aegean Islands (Davis 1965-1985, Davis et al. 1988). In cases of uncertainty, Flora Europaea (Tutin et al. 1964-1981) was used as well. The plants are listed in the appendix according to Davis system (1965-1988). The geographical location (the area lies entirely within "C1 Muğla-Milas-Labranda", which is omitted from the station), collection date, the name of the collector and the collection number were given after the name of every taxon in the list. An asterisk (*) in front of a plant name indicates a new record for the C1 grid square. The abbreviations used in the list are as follows; E. Medit.= East Mediterranean element, Medit.= Mediterranean element, Euro.- Sib.= Euro-Siberian element, Ir.-Tur.= Irano-Turanian element. Author name of every taxon was written according to the Authors of Plant Names (Brummitt and Powell, 1992). The phytogeographical region is cited unless the species has a cosmopolitan and multiregional distribution. The findings of this study were examined and then compared with the results of other researchs (Varol et al., 2004; AYTEPE and Varol, 2005) carried out in nearer locations, according to phytogeographical region and the large families and genera. The plant specimens prepared for herbarium collection have been stored in the Department of Biology, Faculty of Science, Muğla University.

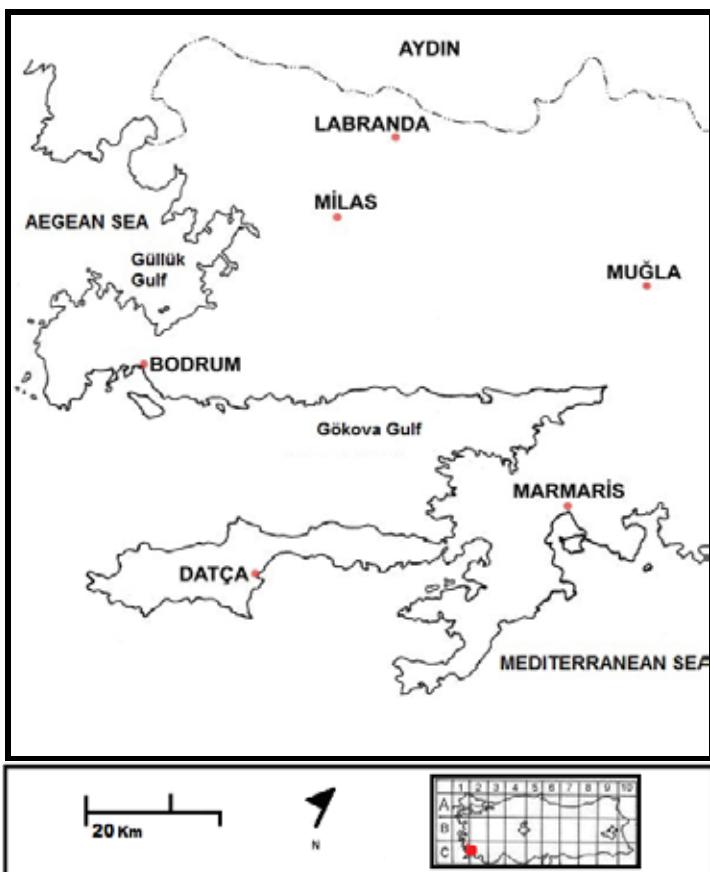

Fig. 1. Labranda location in the province of Muğla.

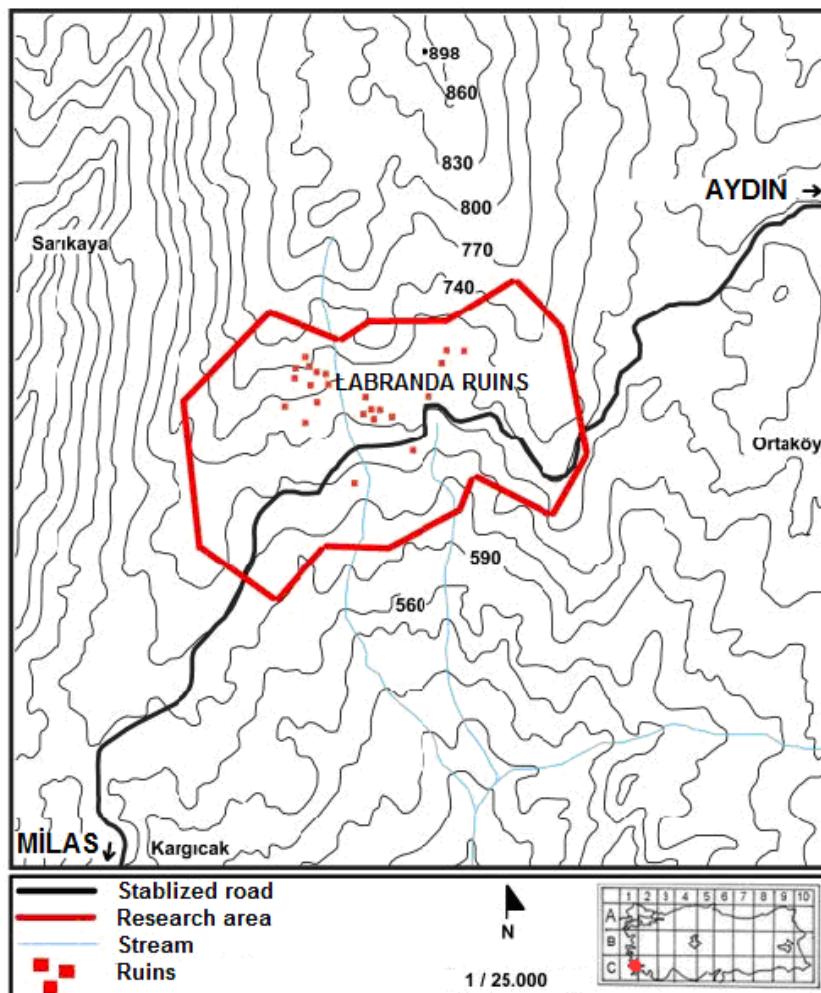

Figure 2. Contour Line map of the study area.

2.1 Abbreviations

Euro.-Sib. ele. : Euro-Siberian element,
 E. Medit. ele. : East Mediterranean element,
 End. : Endemic,
 Ir.-Tur. ele. : Irano-Turanian element,
 Medit. ele. : Mediterranean element.

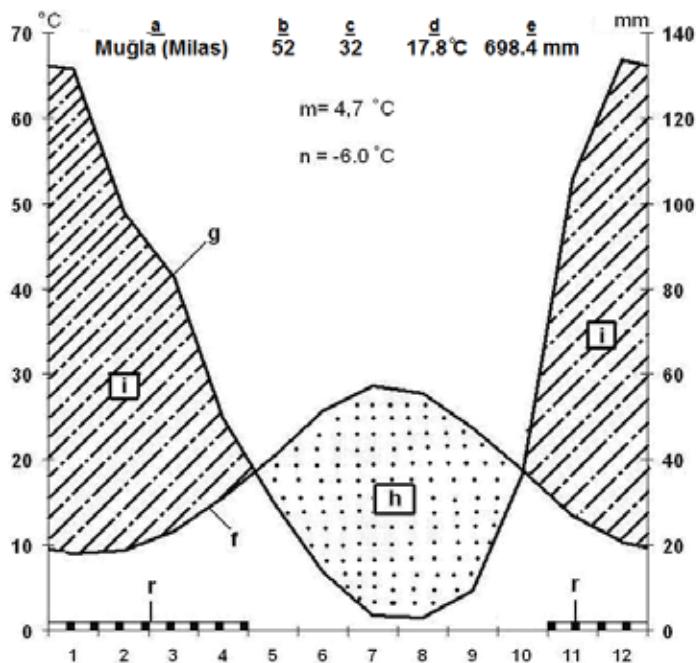

2.2 A brief description of the vegetation

The studied area lies in the west Anatolia. Vegetation types mainly distributed in the study area, are forest vegetation and ruderal vegetation.

Forest vegetation can be found in different zones according to altitude from 560 meters to 750 meters. The overall plants of wood floor are *Pinus brutia* Ten. and *Pinus pinea* L. *Pinus brutia* Ten. and *Pinus pinea* L. communities dominate the northwestern parts of the historical monuments in the center of the field. The remaining parts are completely dominated by *Pinus brutia* Ten. communities.

Ruderal vegetation has a very wide distribution in the center of study area because of the historical remains. Some of plants belonging to ruderal vegetation are; *Malva sylvestris* L., *Capsella bursa-pastoris* (L.) Medik., *Chenopodium botrys* L., *Urtica dioica* L.

Maquis formations can be found in the research area as a result of the destruction of *Pinus brutia* Ten. in the period of transition from ruderal areas to the pine forests. *Olea europaea* L. var. *europaea* and *Pistacia terebinthus* L. subsp. *palaestina* (Boiss) Engler species are found in the study area in western and southern parts. Maquis element of *Nerium oleander* L., *Cistus salviifolius* L. and *Quercus coccifera* L. can be found in eastern regions; *Spartium junceum* L., *Arbutus unedo* L. and *Crataegus monogyna* Jacq subsp. *azarella* (Gris.) Franco. can be found in northern and northeastern areas.

1. Muğla; Milas, Labranda location, within the protected area, inside the ancient city, 620-650 m.
2. Muğla; Milas, Labranda location, within the protected area, southern section of the highway, meadow areas, 580-620 m.
3. Muğla; Milas, Labranda location, within the protected area, western sides of the ancient city, ruderal areas, 620-650 m.
4. Muğla; Milas, Labranda location, within the protected area, southwestern sides of the ancient city, ruderal areas, 610-630 m.
5. Muğla; Milas, Labranda location, within the protected area, northwestern sides of the ancient city, ruderal areas, 630-660 m.
6. Muğla; Milas, Labranda location, within the protected area, northeastern sides of the ancient city, meadow areas, 640-680 m.
7. Muğla; Milas, Labranda location, outside the protected area, northeastern sides of the ancient city, *P. brutia* forest areas, 700-750 m.
8. Muğla; Milas, Labranda location, within the protected area, northern sides of the ancient city, *P. brutia* forest areas, 680-740 m.
9. Muğla; Milas, Labranda location, within the protected area, eastern sides of the ancient city, meadow areas, 630-660 m.
10. Muğla; Milas, Labranda location, within the protected area, the southern parts of the highway, southwest sides of the ancient city, river bank, 570-600 m.
11. Muğla; Milas, Labranda location, along the protected area border on the western side of ancient city, *P. brutia* forest areas, 610-650 m.
12. Muğla; Milas, Labranda location, outside the protected area, northwestern sides of the ancient city, *P. brutia* and *P. pinea* forest areas, 640-700 m.
13. Muğla; Milas, Labranda location, outside the protected area, southwestern sides of the ancient city, the southern parts of the highway, *P. brutia* forest areas, 560-600 m.

14. Muğla; Milas, Labranda location, outside the protected area, eastern sides of the ancient city, *P. brutia* forest areas, 650-700 m.
15. Muğla; Milas, Labranda location, within the protected area, northeastern sides of the ancient city, foothpath roadside, meadow areas, 640-660 m.
16. Muğla; Milas, Labranda location, outside the protected area, western sides of the ancient city, *P. brutia* forest areas, 590-620 m.
17. Muğla; Milas, Labranda location, within the protected area, southwestern sides of the ancient city, the southern parts of the highway, *Olea europaea* areas, 560-580 m.
18. Muğla; Milas, Labranda location, outside the protected area, southwestern sides of the ancient city, river banks, 570-600 m.
19. Muğla; Milas, Labranda location, outside the protected area, southwestern sides of the ancient city, *P. brutia* forest areas, 570-600 m.
20. Muğla; Milas, Labranda location, outside the protected area, all around the ancient city, 550-750 m.
Muğla; Milas, Labranda location, outside the protected area, northwestern sides of the ancient city, 630-710 m..

3. Results

This floristic study was carried out with approximately 727 plant specimens collected between March 2009 – July 2010. As a result of the identification of the plant specimens, 66 families, 197 genera, 335 taxon were determined. Eighteen of the collected taxa are endemic. Sixteen plant samples which identified were collected first time from C1 square (Donner, 1990). Two of the 335 taxa are in *Pteridophyta* while 333 are in *Spermatophyta*. Two of the 333 taxa are in *Gymnospermae* while 331 are in *Angiospermae*. Of these, 284 taxa belong to the class *Dicotyledones*, while the other 47 belong to *Monocotyledones*. The results are summarised in Table 1. The taxa of the study area, categorized according to phytogeographical regions, can be listed as follows: Mediterranean elements 155 (46.26%), Euro-Sib. elements 7 (2.08%) Irano-Turanian elements 6 (1.79%) and the remaining 167 (49.85%) taxa are multiregional. The results of the studies conducted in similar areas, together with the endemic and phytogeographical distribution are presented in Table 2.

This study was carried out in the Mediterranean phytogeographic region and the number of Mediterranean elements is naturally higher than that of the elements of other regions. Irano-Turanian elements have a higher rate on Yılaklı Mountain, the Euro-Siberian elements are approximately at the same rate in all areas. The rate of endemism in our research area and other studies are very low (5.37%), when compared with endemism ratio in the total Flora of Turkey (33%). This ratio may not seem to be high. But, when we focus on the flora in Turkey, it is observed that 85% of the endemic taxa grow between 1000-2000 m. In this case, plains at lower altitudes are poor in terms of endemics. The reason of a higher rate of endemism than other areas on the Yılaklı Mountain can be that vegetation shows diversity because altitude is higher than other areas (Labranda; Aytepe, 2005).

When we compare the number of taxa in families with other areas close to our region, as in our area on Aspat Castle and Bencik Mountain *Asteraceae*, *Fabaceae* and *Poaceae* families are dominant. *Asteraceae*, *Fabaceae* and *Lamiaceae* families are dominant in Yılaklı Mountain. In our working region *Caryophyllaceae* family is found at a higher rate than other areas, *Liliaceae* ve *Orchidaceae* families are at lower rate (Table 3).
