Abstract: This study was carried out on macrofungi samples collected from Ereğli district of Konya between 2017 and 2019. Eighty nine species, belonging to 74 genera, 41 families, 13 orders and 7 classes within Ascomycota and Basidiomycota were determined. The list of the taxa is presented together with their habitats and localities. *Tulostoma niveum* is reported as new record for the mycobiota of Turkey and presented with a short description and photographs.

Ereğli (Konya) Yöresinde Belirlenen Makromantarlar

Öz: Bu çalışma Ereğli (Konya) yöresinden 2017 ve 2019 yılları arasında toplanan örnekler üzerinde gerçekleştirilmiştir. Ascomycota ve Basidiomycota bölgüleri içinde yer alan 7 sınıf, 13 takım, 41 familya ve 74 cinsde 89 tür belirlenmiştir. Türlerin listesi habitat ve lokaliteleri ile birlikte verilmiştir. *Tulostoma niveum* Türkiye mikobiotası için yeni kayıt olarak rapor edilmiş ve kısa betimlemesi ve fotoğraflarıyla verilmiştir.

Introduction

Ereğli is a district of Konya located in Central Anatolian Region of Turkey. The research area is situated between 37°21'-38°01' north latitudes and 33°45'-34°23' east longitudes and takes place in C4 according to Davis' grid square system (Figure 1). According to Emberger's formula (Akman, 1999), the area has a Mediterranean climate. The annual precipitation is 317.7 mm, and the average temperature is 11.7 °C.

Though steppe vegetation is the dominant vegetation in the region, some naturally growing and planted *Pinus nigra* J.F. Arnold, *Juniperus oxycedrus* Hochst., and some *Quercus* L. sp. especially of *Quercus pubescens* Szov. ex A.DC and *Quercus cerris* DC. populations are localized at higher portions of the region. *Salix* L. and *Populus* L. species are also distributed along streamsides.

In a conference paper presented in 14th National Biological Congress, Kaşik and Öztürk (1998) reported 22 macrofungi species from the region. But a detailed

research related to macrofungal biodiversity of Ereğli district haven't been conducted.

The work aims to determine the macrofungal composition of the Ereğli region and make a contribution to the mycobiota of Konya and Turkey.

Material and method

The macrofungi samples were collected between 2017 and 2019 from the region within the boundaries of Ereğli district of Konya (Figure 1). The fruit bodies were photographed at their natural habitats and required ecological characters were noted. Investigations related macroscopy and microscopy of the samples were carried out in the fungarium. Microscopic investigations were performed under a Nikon Eclipse Ci-S trinocular microscope. The samples were identified with the help of Watling (1973), Kers (1978), Phillips (1981), Moser (1983), Breitenbach and Kränzlin (1984, 1986, 1991, 1995, 2000), Miller and Miller (1988), Ellis and Ellis (1990), Buczacki (1992), Hansen and Knudsen (1992,

1997), Jordan (1995), Pegler et al. (1995), Bessette et al. (1997, 2007), Medardi (2006), Hausknecht (2009), Antonin and Noordeloos (2010), Thompson (2013) and Beug et al. (2014).

The specimens are kept at Karamanoğlu Mehmetbey University, Kamil Özdağ Science Faculty, Department of Biology.

Results

Eighty nine macromycete taxa were determined from the research area. The taxa are listed in alphabetical order, considering the taxonomic categories from division to species. Kirk et al., (2008) and Index Fungorum (accessed on 15 June 2021) was followed for the systematics of the taxa.

Discussions

A list of 89 macromycete taxa were presented from Ereğli district of Konya. Twenty nine of them (26 Pezizales, 1 Diaporthales, 1 Patellariales, 1 Xylariales) belong to Ascomycota and 60 of them (39 Agaricales, 7

Boletales, 5 Polyporales, 3 Geastrales, 2 Russulales, 1 Diaportales, 1 Hymenochaetales, 1 Pucciniales, 1 Tremellales) belong to Basidiomycota.

Pyronemataceae was found to be the most crowded family in the region with 13 species. *Agaricaceae*, *Helvellaceae* and *Psathyrellaceae* followed the *Pyronemataceae* with 9, 6 and 5 taxa respectively. Seven of the families (*Gastraceae*, *Hymenogastraceae*, *Morchellaceae*, *Mycenaceae*, *Pezizaceae*, *Pluteaceae*, *Polyporaceae*) are resembled with 3 taxa, 5 of them (*Inocybaceae*, *Pleurotaceae*, *Pezizaceae*, *Sclerodermataceae*, *Strophariaceae*, *Tricholomataceae*) are resembled with 2 taxa, while the rest of the 25 families are resembled with only one taxon in the region.

Helvella L. was found to be the most crowded genus in the research area with 5 taxa. *Tulostoma* is the second crowded one with 3 taxa. Nine genera (*Agaricus*, *Coprinellus*, *Geastrum*, *Morchella*, *Mycena*, *Picoa*, *Pleurotus*, *Scutellinia*, *Volvariella*) are resembled with 2 taxa while the rest of the 62 genera are resembled with only one taxon in the research area.

According to literature 27 of the determined taxa are edible, 58 are inedible and 5 are more or less poisonous. Among the edible taxa, only *Pleurotus ostreatus*, *Terfezia claveryi*, *Morchella elata* and *Morchella esculenta*, are collected and consumed by locals with the local Turkish names "kavak mantarı", "domalan/keme" and "kuzu göbeği" respectively. *Morchella elata*, *M. esculenta* and *T. claveryi* also have commercial value in the region. They are collected and sold during especially May and June. *Agaricus*

xanthodermus, *Coprinopsis atramentaria*, *Helvella lacunosa*, *Inocybe rimosa* and *Sarcosphaera coronaria* are the poisonous species determined in the region.

Eight of the determined taxa (*Coprinellus micaceus*, *Coprinopsis atramentaria*, *Cyclocybe cylindracea*, *Fomes fomentarius*, *Phellinus igniarius*, *Pholiota populnea*, *Pleurotus eryngii*, *P. ostreatus*) were also presented by Kaşık and Öztürk (1998) from the region before. The rest of the taxa (81 species) are reported for the first time from the region. Among the determined taxa *Tulostoma niveum* was presented from Turkey for the first time (Sesli et al., 2020).

Together with the macrofungi taxa previously reported by Kaşık and Öztürk (1998) (*Agaricus bitorquis* (Quél.) Sacc., *Fomes* (Fr.) Fr. sp., *Grifola frondosa* (Dicks.) Gray, *Marasmius oreades* (Bolton) Fr., *Mycena* (Pers.) Roussel sp., *Mycena* sp., *Mycena epipterygia* (Scop.) Gray, *Mycena pura* (Pers.) P. Kumm., *Panaeolus rickenii* Hora, *Pholiota adiposa* (Batsch) P. Kumm., *Protostropharia semiglobata* (Batsch) Redhead, Moncalvo & Vilgalys, *Trametes versicolor* (L.) Lloyd, *Tricholoma inocyboides* Corner, *Vitreoporus dichrous* (Fr.) Zmitr.) and Uzun (2021) (*Trichoglossum walteri* (Berk.) E.J. Durand) the determined macrofungi taxa number within the boundaries of Ereğli district increased to 104.

The determined taxa were also compared with the studies carried out in close environs and some similarities were observed. These studies and the similarity percentages are given in Table 1. The reason for this similarity may be the common climate and vegetation.
