Abstract

University websites serve as sharing information with students whether prospective or enrolled. Often, before entering their departments, students visit them to have an idea as to what it would be like to be a part of that university and/or department. In that sense, websites help students in deciding whether the university matches their expectations. After enrollment, websites start to serve as their representative and an interactive ground for students, academics, and administrative personnel of the university. Because schools exist for students, their opinions matter. This study aimed to have students' opinions of their departmental websites. For the purposes of this study, students of English or related majors (i.e. English language teaching, English linguistics, English language and literature, translation studies, American culture and literature) were sent a questionnaire to find out their opinions of their departments' official websites. The results suggest that there are a number of areas for universities and departments to improve their websites to promote themselves in a more realistic manner that suits needs of their students.

Keywords: Web design; University websites; Academic resumes; Educational marketing; Evaluation of websites; Higher education

Introduction

There are 104 state universities, 62 foundation-owned higher education institutions, and 7 private vocational schools (http://www.yok.gov.tr) in Turkey. However, many homepages and websites of the Turkish universities or their departments have not been very active; even worse, there are many problems with them such as dysfunctional links or existence of missing information. Despite there exists improvement, some problems still remain such as design and layout problems; for instance, those related to information overload, inadequacy of negative space (space around and between the subjects of an image), inappropriate color scheme, or typography, you can see pages relating to announcements or resumes which have not been updated. Especially important are the resumes of academics, recruited by the school, the very existence of which is the student who demands accountability as to the qualifications of the teaching staff including the question as to which course is offered by which academicians with what qualifications based on what criteria.

Theoretical Framework

As part of the new technologies, the Internet and websites are one of the fastest and most effective ways of communication. Compared to traditional ways of communication, Internet-based communication may provide information in either synchronous or asynchronous way. In synchronous communication, the response is received at the same time as the message is sent, that means interaction occurs at the same time like in electronic chat (Ohlund et al., 2000). In asynchronous communication, location and time of each interaction change. Hence, a caller system is needed to receive the message back at a later time. Websites as a part of Internet-based communication keep several advantages of new technologies. Web transmits messages (or information) either to one receiver or more people. Since it is asynchronous, it does not allow real interaction. Its most significant advantage however is its speed, its use in the global environment, and its relatively low cost (Bonchek, 1997, cited in Timisi 2003). The multi-channel environment may facilitate the negotiations between the organization and the public (Kent & Taylor, 1998).

Websites are suitable for two-way communication. As Kent and Taylor (1998) state the web is "an excellent information dissemination tool and useful for getting a message out" (p.325). As an organization, what you would like to announce, what you will let your stakeholders learn about yourself and how much information you will reveal on the website is manipulated by yourself. On the other hand, your stakeholders expect to acquire as much information as they could through this web source.

From the point of this study, students as stakeholders will ask for genuine information about the quality of education, courses, programs as well as on-campus accommodation, social life, and other opportunities offered by the university. While they are seeking answers for their questions on the Internet, the university tries to capture the interest of highly remarkable young talents who have taken high scores from the University Entrance Exam and still in quest of the right university to be enrolled/to make his/her choices in the preference sheet.

University websites with their rich and updated content besides their designs and user-friendly interfaces form a positive image in students' minds while providing detailed information about their educational activities and academic assets. The key point where the university website disseminates information given by the service provider (the university) to the stakeholders (the students) is the quality of that information. Dragulanescu (2002) points out that the information is high quality "if the provider has taken into consideration both the stated and implied needs of the customers/users (before designing, manufacturing, and supplying the product) as well as their reactions (after having supplied the product)".

Kent and Taylor (1998) specify five key strategies to build dialogic communication on the web. These can be reinterpreted as factors to create a successful website:

1. The organization needs to have a feedback loop so that it can provide the information that public needs or desires.

2. Websites should make an effort to include general information valuable for all kinds of public. Publishing historical information is not new but "content is what should drive an effective website, and not the fancy graphics that many web sites currently rely upon".

3. Websites should contain features that make them attractive for repeating visits. Updated information, changing issues, and special forums are some examples.

4. The contents should be well-organized and hierarchical. Like the second factor, authors insist on that the content should be textual rather than graphical although today many experts agree that graphics and textual design must have a balance.

5. About the links to other sites, Kent and Taylor (1998) warn the web designers that offering outer links is usually preferred because of "goodwill" but it might be a handicap as the visitors may never get back to the website. They recommend that web sites should include only essential links with clearly marked paths for visitors to return to the site (Kent & Taylor, 1998, p.330).

Eschenfelder, Beachboard, McClure, and Wyman (1999) published the criteria used to assess the design and management of the U.S. federal government websites. Smith (2001) adapted these criteria of website design from Eschenfelder et al. (1999) to evaluate five governmental websites in New Zealand. In both studies, the criteria were grouped under two headings as information content and ease-of-use. The former, which has 7 or 8 subcategories, refers to the nature of the information, mentioning of the services provided by that website, the accuracy of the web information, privacy of the user, and the use of updated sources as well as data on the website. The latter, having 5 subcategories, is related to links, feedback, accessibility, design, and navigability of the website content. Table 1 shows the criteria specified in the mentioned studies.

Table 1. Comparison of the Website Design and Evaluation Criteria

Criteria used by Smith (2001)	Criteria used by Eschenfelder, Beachboard, McClure, and Wyman (1999)
1 Information Content	**1. Information Content**
1.1. *Orientation to website* (7 criteria): It includes the mission and scope of the website, liability statement, services provided by the website, instructions to use and the news alerts.	1.1. Orientation to website (7 criteria)
1.2. *Content* (10 criteria): It includes matching the mission and the needs of the audience, balanced amount of information, having direct information. It includes criteria about clear, consistent, unbiased, and professional use of language.	1.2. Content (12 criteria)
1.3. *Currency* (3 criteria): This is about the updated content with the identified updating periods.	1.3. Currency (3 criteria)
1.4. *Metadata* (4 criteria): It includes clear headings, appropriate metatags and consistent use of terminology as well as layouts with the headings.	1.4. Bibliographic Control (5 criteria)
1.5. *Services* (3 criteria): Availability of services which are operational and relevant to the user's needs	1.5. Services (4 criteria)
1.6. *Accuracy* (4 criteria): It refers to real information as well as having the sources cited and the accurate use of grammar, spelling and no mistakes of typing.	1.6. Accuracy (criteria)
1.7. *Privacy* (3 criteria): Users' privacy rights and encrypted exchange of information are comprised under this heading.	1.7. Privacy (3 criteria)
1.8. *External recognition* (3 criteria): Ways in which the value of the site is recognized by users such as awards and reviews besides the number of links.	

2. Ease-of-Use Criteria	2. Ease-of-Use Criteria
2.1. *Links* (6 criteria): Updated links, shortcuts, warnings about the links or links to other relevant pages are mentioned in this subsection.	2.1. Quality of links (9 criteria): Speed of links and minimal use of bright colors and large graphics are also included in this subsection.
2.2. *Feedback Mechanisms* (5 criteria): Contact details for entity, data forms and instructions for the user are included.	2.2. Feedback Mechanisms (2 criteria):
2.3. *Accessibility* (6 criteria): Speed of response, easy and rapid access to the website, publishing on the search tools, backlink to the entity and using not a complex URL which is not open to confusion	2.3. Accessibility (4 criteria)
2.4. *Design* (7 criteria): Functional format and graphic design, consistent format through website, use of Standard HTML, use of higher level technology such as frames and Java Script, use of downloadable small-size images and documents	2.4. Design (11 criteria): More detailed criteria of graphics use are included here. Another criterion about attention-getting devices like use of bold, italics and blinking is seen in this subsection.
2.5. *Navigability* (7 criteria): This subsection includes logical organization of the website, use of conventional navigation models with options and facilitated type of browsing as well as providing search engine.	2.5. Navigability (7 criteria)

Source: Smith (2001) and Eschenfelder et al. (1999).

In two other studies, a positive website design has been assessed through different aspects. Kim, et al. (1999) surveyed on health-related websites and peer-reviewed journals to find out common criteria which were being benefited for designing websites on health issues. They included 13 criteria which were rated by the participants. Dragulanescu (2002), however, implemented Total Quality Management tools to make questions for the users to answer about the perfect-like web design which meets the basic needs or desires of web users. Thus, this differs from the others with its focus on the viewpoint of users rather than considering designers' or service providers' perceptions. Table 2 compares the criteria revealed by these two studies.

Table 2. Comparison of the Website Design Criteria of Health-Related Web Design and User-Focused Criteria

Criteria proposed by Kim et. al. (1999)	Criteria proposed by Dragulanescu (2002)
• *Content*: Quality, reliability, accuracy, depth) • *Design and aesthetics*: Layout, interactivity, graphics, use of media • *Disclosure of authors, sponsors, and developers* • *Currency of information*: Frequency of updates • *Authority of source:* Reputation of source, trustworthiness	• *Accuracy:* The extent / degree of information, its exactness and correctness • *Authority:* The extent / degree to which the author could be considered an expert in his / her field. • *Coverage:* The extent / degree to which topics were observed, analyzed, and reported • *Currentness:* The extent / degree to which the distributed information belongs to the time in progress • *Density:* The extent / degree to which comprehensive and relevant information is displayed on the webpage

• *Ease of use:* Usability, navigability)	• *Interactivity:* the extent / degree to which two-way communication is operating between the user and author
• *Accessibility and availability*	
• *Links*	
• *Correct documentation:* presentation of clear references	
• *Intended audience*	
• *Contact addresses/ feedback mechanism*	
• *User support*	
• *Miscellaneous*	

Source: Adapted from Kim, et al. (1999, p.648) and Dragulanescu (2002, p.253).

Studies about guidelines for making successful university or college websites are a few. Borges, Morales, and Rodriguez (1999; cited in Zhang & von Dran, 2000, p.1254) adapted Nielsen's guidelines to evaluate 10 university websites and performed user tests on them. Zhang and von Dran (2000) implemented Herzberg's theory to assess web design to test evaluation on a two-factor model. They formed questions related to features 12 criteria which were grouped under two factors. The questions were replied by a selected group of university students. The two factors they called were hygiene and motivator factors.

Pinto et al. (2009) assessed the information provided by Spanish universities on their websites regarding accreditation procedures. They used metric analysis and SWOT analysis as the methodology. The essential structure was based on 7 main criteria on 70 indicators not equally distributed among all. The visibility of information, correctness and completeness had the greatest number of indicators while authority, updatedness, accessibility, quality assessment, and navigability were the other five criteria to be assessed.

Table 3. Criteria of the Survey on Website Design and Evaluation

Criteria to evaluate the websites	Number of survey questions / Sub-criteria
User perceptions	Q1-Q2-User interest Q3-Manipulative manner Q4-Trustworthiness of the website Q6-User satisfaction
Accuracy	Q5-Accuracy of information
Consistency	Q7-Consistency of quality Q20-Consistency of layout Q25-Consistency of translation
Design	Q8-Plainness Q9-Metadata (hierarchical order of menus) Q10-Q11-Q12-Visual-textual balance Q13-Vividness Q14-Corporate images and colors Q15-Graphics design Q16-Audio-visual format
Content	Q17-Q27-Being informative Q18-Transparency Q22-Categorizing information Q17-Q23-Q26-Use of PR elements

Currency	Q19-Updatedness
Ease-of-use	Q21-Q30-Accessibility of services
Feedback mechanisms / Interactivity	Q24-Student feedback
	Q28-Contact information
	Q29-Server-side scripting

As the above mentioned review of the literature shows, all aspects of websites are currently studied by researchers so as to enhance their potentials in informing users and visitors. This need is also pressing in Turkey where the Internet is currently used for attaining information about locates and contexts that are difficult to reach physically. Hence, this study aimed to collect the opinions of English or related majors (such as English language teaching, English linguistics, English language and literature, English translation studies, American language and literature) about their university's or department's websites.

Methods

Participants

One hundred and twenty-five students from state universities from cities of Tekirdag, Ankara, Istanbul, Izmir, Antalya and Diyarbakir participated in our study. Since most of the web content indexed is English, it is expected of the universities to provide an English version of its website as well. This fact is one of the reasons for us to send questionnaires to those with a command of English. Secondly, learning a foreign language is an imaginatively and cognitively enriching experience, and helps learners see matters or events from multiple perspectives. Besides, their youth suggests their familiarity with technology. Since most of them are females, it is thought that they have been sensitive to the dimension of design.

Instrumentation

For the survey used in this study to evaluate ***website design***, 30 questions have been prepared depending on various aspects of 8 criteria. The 8 main criteria have 24 sub-criteria with varying rates in total. As mentioned before, Table 3 shows these criteria with the sub-criteria for each one and the number of every individual question assessing that sub-criterion.

The criteria of accuracy, design, content, currency, ease-of-use and feedback mechanisms/ interactivity exist somehow in earlier studies in the literature. However, rather than measuring the users' viewpoints, most of the former studies have been based on the criteria significant for web designers or the executives of organizations as being the publishers of their websites. Furthermore, only a few studies have focused on how to improve university websites. Therefore, assessing what university students think about the website of a higher education institution is one of the primary objectives of this study. User perceptions with the four related sub-criteria endeavor to assess to what extent user interest, the manipulative manner of the organization, trustworthiness of the website as a source of information and the general user satisfaction contribute to the success of a website.

The design criterion has 7 sub-criteria including plainness, metadata, visual-textual balance, vividness, the use of corporate images and colors, graphics design and audio-visual format. The

metadata called as 'bibliographic control' in Eschenfelder et al. (1999), is one of the sub-criteria related to web design in our study. Accuracy like in Smith (2001) denotes the accuracy and reality of released information. Currency, as one of the basic criteria of all studies, mentions how much updated information is used on the web. Ease-of-use, like in Kim et al. (1999), has been included as a main criterion. In the survey of website design evaluation, it is accepted as the accessibility of organizational services on the Internet while having a broader sense in the resume evaluation survey with the sub-criteria of accessibility and navigability.

Consistency is one of the main criteria in website design evaluation. It refers to consistency of the quality both on the homepage and on the related departmental websites. It also refers to the consistency of layout and the consistency of translation of Turkish website into foreign languages.

The content here has a narrower meaning for it indicates the characteristics of the information released. It has four sub-criteria of being informative, transparent, categorical, and including elements of public relations with the focus of publicity in general.

Parallel to the current tendencies, interactivity is accepted as one of the basic criteria for the study. Interactivity is named as "feedback mechanisms" by Smith (2001) and Eschenfelder et al. (1999). That is because three questions have direct emphases on acquiring student feedback, publishing contact information to have general feedback and using server-side scripting to make feedback process easier.

The second survey, which aims to evaluate the quality of **academic resumes**, has fewer criteria. There are three main criteria as content, design and ease-of-use. Table 4 reveals the sub-criteria and questions evaluating each one.

Table 4. Criteria of the Survey on Academic Resume Evaluation

Criteria for academic resumes	Number of survey questions/ Sub-criteria
Content	Academic services and products
	Q1-Publications
	Q2-Q10-Q11-Courses offered
	Q3-Research interests
	Q4-Oral presentations
	Q10-Q11-Theses supervised
	Academic competence and skills
	Q5-Q6-Linguistic(L2) competence
	Q7-Academic competence
	Personal information
	Q12-Q13-Q14-Age, marital status, hobbies
	Q8-Q9-Memberships
Design	Q15-Visual format
	Q20-Textual format
	Q21-Downloadable file formats
Ease-of-use	Q16-Accessibility of services
	Q17-Q18-Q19-Navigability

The content here is again related to the information content in resumes while focusing on three different kinds of data. Academic services and products with 5 sub-criteria, academic

competence and skills with 3 sub-criteria and personal information with 3 sub-criteria comprise various aspects of the content.

Similar to the survey of evaluating the design of websites, design criterion is based on textual and visual formats used in the resumes. A third sub-criterion is added to this survey to check the importance of using downloadable file formats. As mentioned before, ease-of-use indicates the accessibility and navigability of the web sources while questioning the relevance of having links to external websites.

Stating more specifically, the questionnaire used in this study included two parts containing 30 items related to university web site in general and 24 to resumes in particular. The survey asked the participants to rate each of the items following on a 1-5 Likert Scale (Strongly agree, Agree, Neutral, Disagree, Strongly disagree). SPSS was used to find out mean scores (along with standard errors and standard deviations) of the items. They ranged from relationship between the effect of a website and the choice of a university to details regarding the information content, layout, and design of the website in general.

The preparation process of the questionnaire started over a year ago, and it has been finalized just before its distribution of the questionnaire used in our study (actually a pilot questionnaire was administered but due to the problems related to its timing, the results were not evaluated). Professional experts' ideas were important, therefore the Web Marketing Association was e-mailed. William Rice, the president, informed that they evaluated all of their websites on the items of design, innovation, content, technology, interactivity, copywriting, and ease of use on a scale of ten (W. Rice, May 4, 2009). The association has been evaluating the universities submitted for web awards (the reader can see their report on the 1,092 sites submitted to the WebAwards in 2010 in our 24 page Attributes of an Award Winning Website Study).

In this study, the feedback about the quality and comprehensiveness of the items were obtained from unstructured interviews with the staff of IT departments, press offices, computer teaching departments, an employee of the Ministry of Culture, and academics actively involved in web design and students' ideas. Web sites of various universities in Turkey were analyzed as well. The questionnaire was made accessible online, and the link was sent online to the participants by mail and by using social network sites' interest groups.

The Cronbach's alpha coefficient of the scale was found to be .927 indicating a relatively high internal consistency of the items. The narration and explanation of the data were as follows: A cut-off point was determined for convenience and ease of reading. The means equal to or above 4.3 (in the tables, those typed in bold) indicated a threshold for good agreement for item whereas those equal to or below 3 (in the tables, those given in italics) was considered to have a lower importance given by the students for the item in question.

Findings

Though lower than the mean score of 4.3, the first item deserves special attention since majority of the students claim to be checking the websites of their future universities before deciding to apply. When they gave their opinion on whether the website of a department had an effect on their decision, they tended to disagree on the effect of the web site in choosing

their department (2.72). However, these results suggest that they give importance to the functions or potential influence of a university website in forming students' opinions who seek for information about their future schools.

Table 5. Students' Opinions of University's and Departments' Websites

	Items	Mean	St Err.	St Dev.
1	I investigate the home page (opening page) of the university before choosing it for application.	3,9120	,11303	1,26374
2	Prior to application to a university, I investigate the web site of the department.	3,7760	,11122	1,24346
3	The home page (opening page) of the university is/was effective on the question to whether or not to apply for the university.	3,0080	,10746	1,20145
4	The web site of a department is /was effective on whether or not to choose it for application.	*2,7200*	,10632	1,18866
5	The web sites of the educational institutions give ideas about the quality of the education given there.	3,6400	,09732	1,08806
6	I am/was content with the web site of my university.	3,4720	,10929	1,22195
7	There should be no difference as to the quality of the home page (opening page) and the sites of departments.	**4,3920**	,07440	,83179
8	The home page (opening page) of web site should be plain.	3,5200	,09477	1,05952
9	Web site should have clear and hierarchically structured submenus.	**4,5600**	,05611	,62733
10	There should be a balance between visual and textual elements.	**4,3120**	,06855	,76639
11	Web site should have visual elements rather than textual ones.	3,0080	,08980	1,00399
12	Web site should have textual elements rather than visual ones.	*2,8960*	,09216	1,03038
13	Web site should have a variety of colors.	3,5520	,08905	,99560
14	Web site should use the logo and theme colors of the university.	3,9360	,08092	,90468
15	Web site should have animations.	3,3040	,09852	1,10149
16	Web site should have music and sound effects.	3,0800	,11393	1,27381
17	Web site should have an introductory video.	**4,5200**	,06584	,73616
18	Web site should provide the institutional information in a transparent manner.	**4,4880**	,06077	,67937
19	Attention should be paid attention to the update the web site.	**4,7280**	,05492	,61403
20	The sites connected to the home page should be in the same format as the opening page.	4,2880	,08410	,94028
21	Web site should contain announcements and news archive, and this archive should be easily accessible.	**4,7120**	,04927	,55089
22	There should be separate sections for announcements each with relevant content for the student, the academician or the general viewer.	**4,3760**	,07842	,87680

23	A press and media section should be constituted for the news related to the university in the press and media.	4,2400	,06947	,77668
24	The web site should have a student portal.	**4,4720**	,06679	,74678
25	The Turkish content in the home page and the department sites should take place in the English web page as well.	**4,4800**	,06486	,72513
26	Web site should have elements aimed for promoting the university rather than providing information about it.	*2,6160*	,08015	,89608
27	Web site should have elements aimed for providing information about the university rather than promoting it.	3,8160	,07482	,83651
28	The home page and sites connected should have the email addresses of the units concerned.	**4,5440**	,05623	,62867
29	To send a message to the unit(s) concerned, the web site should have a message box on the screen.	**4,4480**	,05843	,65323
30	If the university has its own radio station, it should broadcast from the site.	4,2400	,07903	,88354

As seen in Table 5, following points deserve special attention since these results constitute what students demand in that;

- web sites are updated regularly (4.72)

- an announcements section and an easily accessible section for news archive is available (4.71)

- submenus are clear and hierarchically structured (4.56)

- email addresses are shared (4.54)

- an introductory video of the university/ department is uploaded (4.52)

- information about the university is transparent (4.48)

- content is available in English (4.48)

- a message box is available to visitors to send messages to specific units (4.44)

- a student portal is available (4.47)

- the home page (opening page) of the department and that of the university are similar in quality (4.39)

- specific announcements sections are available for target viewers: one for the academics, one for the students and one for the general viewer (4.37)

- there is balance between the textual and the visual (4.31), the textual is not dominant over the visual (2.89)

Table 6. Students' Opinions of the Web-based Information Related to Their Departments' Instructors

	The resumes of the academics should have	Mean	St Err.	St Dev.
1	Information related to articles published.	**4,4160**	,06444	,72048
2	Information related to courses given	**4,5520**	,06570	,73458

3	Information related to his/her research field.	**4,4880**	,06285	,70271
4	Information related to his/her presentations	4,2720	,07307	,81692
5	Information related to their foreign language levels	4,0800	,08160	,91228
6	Their grades for examinations indicating their foreign language proficiency	3,5040	,11338	1,26761
7	Grades for academic examinations like ALES, GRE, GMAT	3,4400	,11438	1,27886
8	Information related to their membership at scientific institutions	4,0560	,08447	,94446
9	Information related to their membership at social institutions	3,6240	,09946	1,11199
10	Information related to projects they manage or participate	**4,3440**	,06335	,70829
11	Information related to MA and PhD theses they have supervised	**4,3760**	,06688	,74773
12	Information related to their age	*2,9520*	,10464	1,16989
13	Information related to their marital status	*2,4160*	,10044	1,12296
14	Information related to their hobbies and interests	3,0560	,10430	1,16608
15	Their updated photographs	3,7040	,09573	1,07030
16	Office hours assigned to meet with students accessible through the web	**4,4400**	,06947	,77668
17	Links to their publications (proceedings, article, sections in a book, books)	**4,4800**	,06584	,73616
18	Links to a mail group if there is any	**4,4000**	,06222	,69561
19	Links to the academics' membership at social networking sites	3,3760	,11565	1,29306
20	Links to the academics' membership at social networking sites	3,9760	,08833	,98754
21	The feature allowing to download them both in word and PDF format.	3,4560	,10442	1,16746

Students' main priority is the updates regularly made by websites to change their content. The second highest mean score is to do with availability of two sections for both announcements and the news archive with easy access. Being aware of current announcements is necessary to facilitate the availability of up-to-the-minute information. The very dimension of current announcements is closely related to updated look. With past announcements archived in a separate section, the site avoids overload of information. The items addressing the usability of e-mail addresses and message box in the first section and the office hours and mails groups in the resume section reflect the demand on their part for instructors communicating and interacting with them.

Preference for the information-based promotional content indicates that students do not want their university to associate a commercial image in its pejorative sense, which, if it had, would do harm to their employment outcomes. In other words, a representation of their university is that of theirs. Enthusiasm for representation is implied in student portals as well. They suggest active, autonomous participation through which they are constructive agents of the institution of higher education. Another major item to attach importance is the expressed need for an introductory video broadcast on the web site, in which the students as well as professors may be shown highlighting the advantages of their education in their university.

The item regarding the English equivalence of the Turkish website may indicate a bias as the participants are English major or related majors. Nevertheless, apart from that possibility, it is a fact that many web sites do not include many important sections addressing international students and foreign academics seeking research partnership, such as announcements that might help international prospective students and other content with potential for relevancy. The translation is also deficient in terms of use of natural English, and lack of cross-linguistic equivalence for specialized terminology sometimes to the point of negative products of machine translation. Another interesting information is the availability of irrelevant content overloaded with legal terms (law number of a regulation). In the resume section, the emphasis is on the need for the following (8 agreed and 2 disagreed items out of 21):

- information related to the articles written (4.41),
- courses offered (4.55),
- their research field/interests (4.48),
- projects conducted or participated (4.34),
- Master's and doctoral theses supervised (4.37),
- office hours assigned for meetings with the students (4.44),
- links to their publications (4.48)
- their mail groups (4.40).

These results suggest that students attach the least importance to those information pieces related to their instructors' age and marital status although some departments advertise such status the reason of which remains undisclosed. Many mean scores in resume section are expected. One of the more interesting ones is that for the item to do with master's and doctoral theses supervised. This item is important for those keen on research or in pursuit of a research career. Research makes a university a high-ranked one. In terms of competing for jobs, postgraduate education gains importance to make students stand out amongst the undergraduates, whose numbers increased.

Conclusions and Implications

Tasks related to website development are important. According to Thelwal, Binns, Harries, Page-Kennedy, Price, and Wilkinson, (2007), a university website provides scholarly and pedagogical information. Secondly, it functions "as a marketing tool for prospective students about the courses available and the university itself. Third, it contains "information about the research conducted at the university, including details of active scholars, groups, and projects" (Thelwal, et al., 2007, p.95). Once indexed by a search engine, the university website not only facilitates international collaboration of academics seeking research partners home and abroad but also introduces itself as an alternative choice for students, both home and overseas, with an international appeal. Given the steady economic growth of Turkey, the Turkish government should allocate funds for projects related to the scope and quality of the websites of Turkish universities so that they use the Internet to get broader recognition.

In the future, communicative tasks related to university web designs would encourage them to participate more actively in their learning processes. However, it is our observation that

students do not participate actively in processes in learning English in or out of class. It is not innate, but just the way they have been socialized to study or learn. However, the more involved a learner is, the better they will learn (involvement load hypothesis; Hulstijn & Laufer, 2001). An interesting idea would be involving them as active contributors in the co-construction of the website of their school. A web task might involve learners' sensitivities to issues of discourse such as genre and register along with non-linguistic features (audio and/or visual) or cognitive load embedded in the teaching materials. They could gain sociolinguistic dimensions of vocabulary from this relevant kind of task-induced involvement could benefit from (involvement load hypothesis; Hulstijn & Laufer, 2001). Another point worth to mention is that most of the English or related majors are women, who can contribute especially to visual aspects of design. According to Franklin, a professor of educational studies, instructional technology (personal communication, May 25, 2011), women are very good at visualization of images, which she witnessed in hiring females as designers, and they are large users of Internet in any culture (except the closed ones, where their access is denied).

As for the process related to design, it can also be an imaginatively enriching experience with gift of looking at matters from different perspectives. It would be enriching in terms of the existing literature on websites as well which reminds us of Derrida's famous quote "everything is text". The web related tasks may provide job opportunities. Whether English or related majors pursue a teaching career or not media literacy is a good asset for them. One of the most important features students are the most active producers is student portals, which, in Franklin's words (personal communication, May 25, 2011) is the next hot thing in USA. After all, learners are expected to participate in their learning processes in US or UK school settings; it is a part of learning culture in these contexts, which is also expected of learners of English to be aware of as a part of intercultural competence. The way the questionnaire was responded suggested an idea on involvement or participation. In the case participation in works requiring multiple disciplines, our study has implications for promising collaboration of English majors with other majors professionally (professional web designers, bloggers, advertisers, journalists, etc.) as well as academically through the implementation of interdisciplinary studies or double majors (e.g. CEIT and ELT).

We hope that our study might influence ESL teachers to entertain the thought of benefiting from web tasks for themselves and students. Wondering if TBLT might work for "teachers and learners in the classroom as it does for SLA research", van den Branden (2006) underlines the lack of empirical research conducted on the use of tasks as "basic units for the organization of educational activities in intact language classrooms" (p.1). Whether web development tasks may be evaluated in classrooms effectively in task-based language teaching approach (TBLT) may be investigated in future research, though we should be aware of the distance between rhetoric and the realities, as Nunan is reported in Feeney's book review (2006) to caution us against in comment on the increase on the number of the textbooks based on TBLT.
