### Abstract

*Aim of study:* The present study aimed to contribute Geometridae (Lepidoptera) fauna of Karabük province.

*Area of study:* The study was carried out in Karabük province located in Western Black Sea Region.

*Material and methods:* The samples were collected by light trap in May-October between in 2008-2012.

*Main results:* In this study, 755 samples were evaluated. As a result of the study, 88 species belonging to 5 subfamilies have been determined as Orthostixinae (1 species), Geometrinae (5), Sterrhinae (27), Larentiinae (25) and Ennominae (30).

*Highlights:* Knowledge of the Geometridae fauna of Karabük province was very limited. There were 83 species recorded from Karabük province for the first time during this research. Faunistic records on *Cyclophora punctaria fritzae* were discussed and figure of male genitalia presented.

**Keywords:** *Cyclophora punctaria fritzae*, Geometridae, Fauna, Karabük, Türkiye

## Karabük İlinin Geometridae (Lepidoptera) Faunasına Katkılar

### Öz

*Çalışmanın amacı:* Bu çalışmada Karabük ilinin Geometridae (Lepidoptera) faunasına katkı sağlanması amaçlanmıştır.

*Çalışma alanı:* Çalışma Batı Karadeniz Bölgesinde yer alan Karabük İlinde yapılmıştır.

*Materyal ve yöntem:* Örnekler 2008-2012 yılları arasında, Mayıs-Ekim aylarında ışık tuzağı ile toplanmıştır.

*Temel sonuçlar:* Bu çalışmada 755 örnek değerlendirilmiştir. Çalışma sonucunda 5 alt familyaya ait 88 tür belirlenmiştir (Orthostixinae 1 tür, Geometrinae 5, Sterrhinae 27, Larentiinae 25 ve Ennominae 30).

*Araştırma vurguları:* Karabük ilinin Geometridae faunası ile ilgili bilgiler oldukça sınırlıdır. Bu çalışma ile 83 tür Karabük ilinde ilk defa tespit edilmiştir. *Cyclophora punctaria fritzae* ile ilgili faunistik kayıtlar tartışılmış ve erkek genital fotoğrafı verilmiştir.

**Anahtar Kelimeler:** *Cyclophora punctaria fritzae*, Geometridae, Fauna, Karabük, Türkiye.

## Introduction

The geometrids (Geometridae) are the most species-rich family of Lepidoptera apart from Noctuidae and Pyralidae. There are over 23000 decrypted species known worldwide (Scoble & Hausmann, 2007), 900 in Europe (Hausmann, 2001) and 685 in Turkey (Koçak & Kemal, 2018). Geometrid species are ordinarily nocturnal, they often fly preferably at dusk, others are said to be active mainly after midnight, but some species fly by day. This group served as indicators for environmental changes and appear to be effective at colonizing habitats after natural or anthropogenic disturbances also (Enkhtur et al., 2020). Some species are important pests for agriculture and forestry (Hausmann, 2001).

The study area, located in the Western Black Sea Region of Turkey, has an oceanic climate character in general. On the other hand, floristically, its central and southern parts are in the Mediterranean or the drier regions are in Irano-Turanian characters. Humid-mild deciduous forests composed of *Fagus orientalis* Lipsky. Mixed forests in humid areas consist of *Abies nordmanniana* subsp. *bornmulleriana* Mattf. *F. orientalis* and *Pinus sylvestris* L. Coniferous forests are in the form of *P. sylvestris* forest, *Pinus nigra* J. F. Arnold forest and *Pinus brutia* Ten. mixed forest. In the southward, in areas where the effect of the Black Sea has decreased, *Quercus* sp. and *Pinus nigra* communities are seen. Some areas are covered by shrubs with maquis elements. *Arbutus andrachne* L. communities are found in low areas where this vegetation is seen. (Coşkun, 2017). Yenice Forests, located in Karabük province, are among the 100 hot spots (important regions on global scale for conservation of biodiversity that include high numbers of species) determined by WWF (World Wide Fund for Nature) in the world. It is also one of the 9 hot spots and 122 Important Plant Areas in Turkey floristically (Aytegin et al., 2019)

Studies on Geometridae fauna in the Western Black Sea Region started with Schwingenschuss (1939a, 1939b) in Bolu province. Seven (1991, 1995), Koçak & Seven (1996), Koçak & Kemal (2001, 2002, 2006a, 2006b), Akbulut et al. (2003),

Özdemir (2007), Can (2008), Okyar et al. (2009), Akkuza et al. (2015) and Özdemir (2016, 2019a) can be given as important studies on Geometridae in close places to study area. The knowledge on Geometridae fauna of Karabük province is quite limited. There were 9 species recorded from Karabük until this research (Okyar, 2012; Koçak & Kemal, 2018).

In the last study (Özdemir, 2019b), in which the habitat preferences of Geometridae species detected in the Western Black Sea region were evaluated, the species were listed together with the habitat preferences, but locality data could not be given. In this study, the species identified from Karabük province are presented together with locality information and distribution in Turkey and discussed together with previous faunistic records. This study was carried out to contribute to the limited knowledge about the Geometridae fauna of Karabuk province.

## Material and Methods

Study area located in between  $40^{\circ} 57'$ ,  $41^{\circ} 34'$  N and  $32^{\circ} 04'$ ,  $33^{\circ} 06'$  E coordinates. The specimens collected by light trap (8W black light fluorescent lamp) from Karabük Province during the years 2008-2012 were investigated. Hausmann (2001, 2004), Mironov (2003), Hausmann & Viidalepp (2012), Skou & Sihvonen (2015) were used for identification. Materials were stored at Nazife Tuatay Plant Protection Museum of Ankara Plant Protection Central Research Institute.

#### Discussion

In this study, 755 samples were examined and 88 species belonging to 5 subfamilies were identified. The distribution of these species to their subfamilies are Orthostixinae 1 species, Geometrinae 5, Sterrhinae 27, Larentiinae 25 and Ennominae 30. Nine species, such as *Aplasta ononaria*, *Camptogramma bilineata* (L.) *Idaea fuscovenosa*, *I. humiliata*, *I. ochrata*, *I. rufaria*, *I. trigeminata*, *Rhodostrophia discopunctata* and *Scotopteryx luridata* (Hufnagel, 1767) were previously known from the Karabük province (Okyar, 2012, Koçak and Kemal, 2018). Among them *A. ononaria*, *I. humiliata*, *I. rufaria*, *I. trigeminata*, *R. discopunctata* were recorded from the study area with this paper also. Consequently, 83 species were recorded for

the first time from this province and the number of known species increased to 92.

*Cyclophora punctaria* (Linnaeus, 1758) was known in Turkey from Adana, Amasya, Artvin, Bitlis, Bursa, Çanakkale, Düzce, İstanbul, Konya, Kahramanmaraş, Ordu, Samsun, Siirt and Tokat, provinces (Koçak and Kemal, 2018). *C. punctaria* ssp. *fritzae* was described by Hausmann (2003) from Caucasus. Hausmann (2004) diagnosed it from nominative subspecies with a strongly curved fibula (30-70°) of the male genitalia and gave its distribution from the Crimean peninsula to the Caucasus, the north east of Turkey and the north of Iran. In the same study, the distribution of nominative subspecies in Turkey was presented as a part of Thrace and the eastern Mediterranean and southwestern Aegean regions. Kemal and Koçak (2017) recorded ssp. *fritzae* from Mutki district in Bitlis province where southeastern part of Turkey. In this study, the curvature of fibula was measured above 70 degrees in the examined materials and determined as ssp. *fritzae*. This record is important to see the distribution of this spp. in the North-western part of Anatolia. It is clear that the new studies are necessary for evaluation on distribution of *C. punctaria* ssp. *fritzae* and nominative subspecies in Turkey. Male genitalia of ssp. *fritzae* were given in figure 1.
