ABSTRACT

This study was carried out in the maize cultivation areas of Aksaray, Kırşehir, Konya, Karaman, Nevşehir, Niğde, Kayseri, Kırıkkale, Ankara, Eskişehir, Sivas, Yozgat and Çankırı provinces in the Central Anatolia Region between 2017 and 2022. Surveys were carried out in three different phenological periods of maize, according to the simple random sampling method. In each location where the research was conducted, plants on 2-meter rows at 5 points were examined using visual inspection and traps in the first two periods, and using visual inspection and a Japanese umbrella in the 3rd period. Results showed that 36 species, belonging to 25 genera from 10 families (Alydidae, Anthocoridae, Berytidae, Geocoridae, Lygaeidae, Miridae, Nabidae, Pentatomidae, Rhopalidae, Tingidae) were recorded. Among them, *Leucodellus zagdani* (Putshkov, 1970) was the second record in Türkiye, and the first record for maize. *Kalama trimazeis* (Schrank, 1801) was reported for the third time in the fauna of Türkiye.

INTRODUCTION

Maize (*Zea mays* L., Poaceae: Poales), which has been cultivated for thousands of years, is a warm climate grain that can be cultivated in almost every climate zone in the world, except the Antarctic continent. Among the world's grain production (about 3 billion tons), maize ranks first in terms of production (about 1 billion tons) and second in terms of cultivation area (about 730 million hectares), with

approximately 196 million hectares (Anonymous 2020). Approximately 20% of world maize production is used for human food (direct consumption), 10% for processed food, 10% for other consumption and seed, and 60% for animal feed (Özcan 2009). Thirty-five percent of the maize grown in Türkiye is used in human nutrition, 30% in animal feed, and 20% in the animal feed industry (Gençtan et al. 1995).

Maize, which is grown in almost all regions of Türkiye, ranks third after wheat and barley in terms of production (Anonymous 2014), is cultivated in an area of approximately 12.900 thousand decares, and approximately 34 million tons of product is obtained (Anonymous 2021).

In Türkiye, the increase in irrigated areas in agriculture, the development of animal husbandry, agricultural support policies, etc. for these reasons, maize cultivating areas in the Central Anatolia Region have increased during the last decades and, consequently, entomological pests have raised. Nowadays, there are more than 400 more or less species harmful to maize, which cause damage in different phenological stages of the plant (Şimşek 2004). In the study conducted for this purpose, Heteroptera species found in the maize plant were also identified.

Heteroptera Latreille, 1810 is one of the largest and most diverse groups of insects, with more than 45.254 described species. Among these, 8.354 species in 1.520 genera are recorded in the Palaearctic region (Henry 2017). Studies on the Heteroptera in Türkiye indicated that more than 1.500 Heteroptera species have been recorded so far, which represents about 5% of the insect fauna (Tezcan 2020). The present study aims to provide an updated checklist of Heteroptera species, in Türkiye, as well as to refer *Leucodellus zagdani* as a new record for maize.

MATERIALS AND METHODS

Heteroptera specimens were collected during the spring, summer, and autumn of 2017-2022 from Aksaray, Kırşehir, Konya, Karaman, Nevşehir, Niğde, Kayseri, Kırıkkale, Ankara, Eskişehir, Sivas, Yozgat, and Çankırı provinces of the Central Anatolia region. The surveys were conducted in 13 provinces, 77 districts and 304 locations (Figure 1) on a total of 54.720 maize plants in 3 different phenological stages of maize. Surveys were carried out by visual inspection and using a net trap in 5 points of each location in the first two phenologic periods of the maize and both visual inspection

and using a Japanese umbrella in the 3rd period. Materials were deposited in the Nazife Tuatay Plant Protection Museum (Ankara).

RESULTS

In the study, 36 species, 25 genera and 10 families belonging to the Heteroptera from Türkiye are included. The species were listed below.

HETEROPTERA (HEMIPTERA)

Family ALYDIDAE Amyot and Serville, 1843

Genus: *Alydus* Fabricius, 1803

Alydus calcaratus (Linnaeus, 1758)

Material examined: Ankara, Ayaş 737 m, 40°01'887"N, 32°17'71"E, 2.07.2020, ♀, ♂.

Previous records: Adana, Amasya, Ankara, Artvin, Balıkesir, Bayburt, Çankırı, Çorum, Erzurum, Giresun, İzmir, Kars, Kastamonu, Kayseri, Tokat, Trabzon (Önder et al. 2006, Dursun and Fent 2009, Yıldırım et al. 2011, 2013, Fent and Japoshvili 2012, Küçükbaşmacı and Kiyak 2015, Zengin and Dursun 2019, Akman and Dursun 2021, Kiyak and Baş 2021).

Family ANTHOCORIDAE Fieber, 1836

Genus: *Cardiastethus* Fieber, 1860

Cardiastethus nazarenus Reuter, 1884

Material examined: Kayseri, Bünyan, Büyüktuzhisar, 1208 m, 38°57'8"N, 35°50'15"E, 19.09.2019, ♀, ♂; Bünyan, Karataş, 1437 m, 38°38'67"N, 35°56'68"E, 19.09.2019, ♀, ♂; Melikgazi, Yeşilyurt, 1086 m, 38°48'73"N, 35°36'54"E, 19.09.2019, ♀, ♂; Yahyalı, İlyashi, 1081 m, 38°10'82"N, 35°17'91"E, 18.09.2019, ♀, ♂; Yeşilhisar, Musahacılı, 1077 m, 38°12'53"N, 35°17'97"E, 18.09.2019, ♀, ♂.

DISCUSSION

With the increase in the area under maize cultivation in Türkiye due to the expansion of irrigated areas in agriculture, the development of livestock farming, policies to support agriculture, etc., the area under maize cultivation in the Central Anatolia region has increased day by day, and continues to increase.

Individual studies have been conducted in the Central Anatolia region, which has a wide host range and where the corn cultivation area has increased rapidly in recent years and constitutes 24% of Türkiye's total corn cultivation area (Ayrancı and Sade 2005, Elmali 1996). Except for the study by Ercan (2006), no study has been realized to date. This study is the first and fundamental for our region, the provinces of the Central Anatolia region.

The research material for this study is 54.720 maize plants in three different phenological stages that were sampled from 304 locations across 77 districts in the provinces of Aksaray, Kırşehir, Konya, Karaman, Nevşehir, Niğde, Kayseri, Kırıkkale, Ankara, Eskişehir, Sivas, Yozgat, and Çankırı in Central Anatolia between 2017 and 2022. The result of the determination of the collected material was 883 samples belonging to 36 species from 25 genera from 10 families, including Alydidae (2 samples), Anthocoridae (302 samples), Berytidae (2 samples), Berytidae (2 samples), Geocoridae (2 samples), Lygaeidae (139 samples), Miridae (243 samples), Nabidae (163 samples), Pentatomidae (14 samples), Rhopalidae (14 samples), Tingidae (2 samples) (Figure 2). Among them, Leucodellus zaghdi (Putshkov, 1970) is recorded for the second time and Kalama trimaizeis (Schrank, 1801) for the third time for the fauna of Türkiye. In addition, Leucodellus zaghdi is reported as a new record for maize.

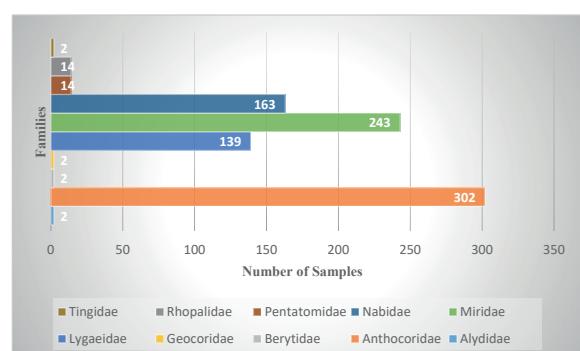

Figure 2. Numbers of families' specimens

Species recorded from Çankırı belong to 10 families (Figure 2). The majority of them belong to the families Miridae (25%, 9 species), Lygaeidae (16%, 6 species), Anthocoridae (14%, 5 species), Rhopalidae (14%, 5 species), Pentatomidae (11%, 4 species), and Nabidae (8%, 3 species). Berytidae (3%, 1 sample), Alydidae (3%, 1 sample), Geocoridae (3%, 1 sample), and Tingidae (3%, 1 species) were underrepresented in the Heteroptera fauna of the Central Anatolia region when compared to the fauna of Türkiye (Figure 3). The underrepresentation of these families is probably due to the methods that we used to collect specimens.

ÖZET

Bu çalışma, 2017-2022 yılları arasında İç Anadolu Bölgesi'nde yer alan Aksaray, Kirşehir, Konya, Karaman, Nevşehir, Niğde, Kayseri, Kırıkkale, Ankara, Eskisehir, Sivas, Yozgat ve Çankırı illerinin mısır ekim alanlarında yürütülmüştür. Araştırmalar basit tesadüfi örnekleme yöntemine göre mısırın üç farklı fenolojik döneminde gerçekleştirilmiştir. Araştırmanın yapıldığı her lokasyonda 5 noktada 2 metrelük sıralar üzerinde bulunan bitkiler, ilk iki dönemde görsel inceleme ve tuzak kullanılarak, 3. dönemde ise görsel inceleme ve Japon şemsiyesi kullanılarak survyeyle yapılmıştır. Bu çalışmada 10

familyaya bağlı (Alydidae, Anthocoridae, Berytidae, Geocoridae, Lygaeidae, Miridae, Nabidae, Pentatomidae, Rhopalidae, Tingidae) 25 cinse ait 36 tür kaydedilmiştir. Bunlardan *Leucodellus zagdani* (Putshkov, 1970) Türkiye faunası için ikinci kez ve mısır için yeni kayıt, Kalama trimaizeis (Schrank, 1801) ise üçüncü kez kaydedilmiştir.

Anahtar kelimeler: mısır, survye, Heteroptera, yeni kayıt, İç Anadolu Bölgesi, Türkiye
