**ABSTRACT.** Let  $R$  be a ring and  $n$  a fixed positive integer. A right  $R$ -module  $M$  is called strongly  $J$ - $n$ -injective if every  $R$ -homomorphism from an  $n$ -generated small submodule of a free right  $R$ -module  $F$  to  $M$  extends to a homomorphism of  $F$  to  $M$ ; a right  $R$ -module  $V$  is said to be strongly  $J$ - $n$ -flat, if for every  $n$ -generated small submodule  $T$  of a free left  $R$ -module  $F$ , the canonical map  $V \otimes T \rightarrow V \otimes F$  is monic; a ring  $R$  is called left strongly  $J$ - $n$ -coherent if every  $n$ -generated small submodule of a free left  $R$ -module is finitely presented; a ring  $R$  is said to be left  $J$ - $n$ -semihereditary if every  $n$ -generated small left ideal of  $R$  is projective. We study strongly  $J$ - $n$ -injective modules, strongly  $J$ - $n$ -flat modules and left strongly  $J$ - $n$ -coherent rings. Using the concepts of strongly  $J$ - $n$ -injectivity and strongly  $J$ - $n$ -flatness of modules, we also present some characterizations of strongly  $J$ - $n$ -coherent rings and  $J$ - $n$ -semihereditary rings.

**Keywords:** Strongly  $J$ - $n$ -injective module, strongly  $J$ - $n$ -flat module, strongly  $J$ - $n$ -coherent ring,  $J$ - $n$ -semihereditary ring

### 1. Introduction

Throughout this paper,  $m$  and  $n$  are positive integers unless otherwise specified,  $R$  is an associative ring with identity,  $I$  is an ideal of  $R$ ,  $J = J(R)$  is the Jacobson radical, and all modules considered are unitary.

Recall that a ring  $R$  is called *left coherent* [2,14] (resp., *left semihereditary* [1]) if every finitely generated left ideal of  $R$  is finitely presented (resp., projective). Left coherent rings, left semihereditary rings and their generalizations have been studied by many authors. For example, a ring  $R$  is said to be *left  $J$ -coherent* [6] (resp., *left  $J$ -semihereditary* [6]) if every finitely generated left ideal in  $J(R)$  is finitely presented (resp., projective); a ring  $R$  is said to be *left  $n$ -coherent* [13] (resp., *left  $n$ -semihereditary* [18,19]) if every  $n$ -generated left ideal of  $R$  is finitely presented (resp., projective). By [19, Theorem 1], a ring  $R$  is left  $n$ -semihereditary if and only

if every  $n$ -generated submodule of a projective left  $R$ -module is projective. Let  $I$  be an ideal of  $R$ . Then according to [20],  $R$  is called *left  $I$ - $n$ -coherent* (resp., *left  $I$ - $n$ -semihereditary*) if every  $n$ -generated left ideal in  $I$  is finitely presented (resp., projective).

In this article, we extend the concept of left  $J$ - $n$ -coherent rings to *left strongly  $J$ - $n$ -coherent rings*. We call a ring  $R$  left strongly  $J$ - $n$ -coherent if every  $n$ -generated small submodule of a free left  $R$ -module is finitely presented, and we call a ring  $R$  left  $J$ - $n$ -semihereditary if every  $n$ -generated small left ideal of  $R$  is projective. To characterize left strongly  $J$ - $n$ -coherent rings, in Section 2 and Section 3, strongly  $J$ - $n$ -injective modules and strongly  $J$ - $n$ -flat modules are introduced and studied respectively. In Section 4 and Section 5, left strongly  $J$ - $n$ -coherent rings and left  $J$ - $n$ -semihereditary rings are investigated respectively.

For any  $R$ -module  $M$ ,  $M^*$  denotes  $\text{Hom}_R(M, R)$ , and  $M^+$  denotes  $\text{Hom}_{\mathbb{Z}}(M, \mathbb{Q}/\mathbb{Z})$ , where  $\mathbb{Q}$  is the set of rational numbers, and  $\mathbb{Z}$  is the set of integers. In general, for a set  $S$ , we write  $S^n$  for the set of all formal  $1 \times n$  matrices whose entries are elements of  $S$ , and  $S_n$  for the set of all formal  $n \times 1$  matrices whose entries are elements of  $S$ . Let  $N$  be a left  $R$ -module,  $X \subseteq N_n$  and  $A \subseteq R^n$ . Then we define  $\mathbf{r}_{N_n}(A) = \{u \in N_n : au = 0, \forall a \in A\}$  and  $\mathbf{l}_{R^n}(X) = \{a \in R^n : ax = 0, \forall x \in X\}$ .

## 2. Strongly $J$ - $n$ -injective modules

Recall that a submodule  $U'$  of a right  $R$ -module  $U$  is called a *pure* submodule of  $U$  if the canonical map  $U' \otimes_R M \rightarrow U \otimes_R M$  is a monomorphism for every left  $R$ -module  $M$ , equivalently, if the canonical map  $U' \otimes_R V \rightarrow U \otimes_R V$  is a monomorphism for every finitely presented left  $R$ -module  $V$ . Let  $I$  be an ideal of  $R$ . Then following [21], a left  $R$ -module  $V$  is said to be  *$I$ - $(m, n)$ -presented*, if there is an exact sequence of left  $R$ -modules  $0 \rightarrow K \rightarrow R^m \rightarrow V \rightarrow 0$  with  $K$  an  $n$ -generated submodule of  $I^m$ ; a left  $R$ -module  $V$  is said to be  *$I$ -finitely presented*, if it is  $I$ - $(m, n)$ -presented for a pair of positive integers  $m, n$ . In [21], we extend the concept of pure submodules to  *$I$ - $(m, n)$ -pure* submodules,  *$I$ - $(m, \infty)$ -pure* submodules,  *$I$ - $(\infty, n)$ -pure* submodules and  *$I$ -pure* submodules respectively. Given a right  $R$ -module  $U$  with submodule  $U'$ , according to [21],  $U'$  is called  *$I$ - $(m, n)$ -pure* in  $U$  if the canonical map  $U' \otimes_R V \rightarrow U \otimes_R V$  is a monomorphism for every  $I$ - $(m, n)$ -presented left  $R$ -module  $V$ ;  $U'$  is said to be  *$I$ - $(m, \infty)$ -pure* (resp.,  *$I$ - $(\infty, n)$ -pure*) in  $U$  in case  $U'$  is  $I$ - $(m, n)$ -pure in  $U$  for all positive integers  $n$  (resp.,  $m$ );  $U'$  is said to be  *$I$ -pure* in  $U$  in case  $U'$  is  $I$ - $(m, n)$ -pure in  $U$  for all positive integers  $m$  and  $n$ . By [21, Theorem 2.4], we have immediately the following two lemmas.

**Lemma 2.1.** *Let  $U'_R \leq U_R$ . Then the following statements are equivalent:*

- (1)  $U'$  is  $J$ - $(n, \infty)$ -pure in  $U$ .
- (2) For every finitely generated free right  $R$ -module  $F$  and each  $n$ -generated small submodule  $T$  of  $F$ , the canonical map

$$\text{Hom}_R(F/T, U) \rightarrow \text{Hom}_R(F/T, U/U')$$

*is surjective.*

**Lemma 2.2.** *Let  $U'_R \leq U_R$ . Then the following statements are equivalent:*

- (1)  $U'$  is  $J$ - $(\infty, n)$ -pure in  $U$ .
- (2) For every finitely generated small submodule  $T$  of  $R^n$ , the canonical map  $\text{Hom}_R(R^n/T, U) \rightarrow \text{Hom}_R(R^n/T, U/U')$  is surjective.

Recall that a right  $R$ -module  $M$  is called  $I$ - $(m, n)$ -injective [21], if every  $R$ -homomorphism from an  $n$ -generated submodule  $T$  of  $I^m$  to  $M$  extends to one from  $R^m$  to  $M$ . A right  $R$ -module  $M$  is called  $I$ - $n$ -injective [20] if it is  $I$ - $(1, n)$ -injective. Inspired by these concepts, we introduce the concept of strongly  $J$ - $n$ -injective modules as follows.

**Definition 2.3.** A right  $R$ -module  $M$  is called strongly  $J$ - $n$ -injective if every  $R$ -homomorphism from an  $n$ -generated small submodule of a free right  $R$ -module  $F$  to  $M$  extends to a homomorphism of  $F$  to  $M$ . A right  $R$ -module  $M$  is called  $J$ -FP-injective if every  $R$ -homomorphism from a finitely generated small submodule of a free right  $R$ -module  $F$  to  $M$  extends to a homomorphism of  $F$  to  $M$ . A ring  $R$  is called right strongly  $J$ - $n$ -injective (resp., right  $J$ -FP-injective) if the right  $R$ -module  $R_R$  is strongly  $J$ - $n$ -injective (resp.,  $J$ -FP-injective).

It is easy to see that a right  $R$ -module  $M$  is strongly  $J$ - $n$ -injective if and only if it is  $J$ - $(m, n)$ -injective for every positive integer  $m$ ; a right  $R$ -module  $M$  is  $J$ -FP-injective if and only if it is strongly  $J$ - $n$ -injective for every positive integer  $n$ .

**Theorem 2.4.** *Let  $M$  be a right  $R$ -module. Then the following statements are equivalent:*

- (1)  $M$  is strongly  $J$ - $n$ -injective.
- (2)  $\text{Ext}^1(F/T, M) = 0$  for every free right  $R$ -module  $F$  and every  $n$ -generated small submodule  $T$  of  $F$ .
- (3)  $\text{Ext}^1(F/T, M) = 0$  for every finitely generated free right  $R$ -module  $F$  and every  $n$ -generated small submodule  $T$  of  $F$ .
- (4)  $\mathbf{l}_{M^n \mathbf{r}_{R^n}} \{\alpha_1, \dots, \alpha_m\} = M\alpha_1 + \dots + M\alpha_m$  for every positive integer  $m$  and any  $\alpha_1, \dots, \alpha_m \in (J(R))^n$ .

- (5)  $M$  is  $J$ -( $n, \infty$ )-pure in every module containing  $M$ .
- (6)  $M$  is  $J$ -( $n, \infty$ )-pure in  $E(M)$ .

**Proof.** It follows from [21, Theorem 3.2]. □

**Corollary 2.5.** *Every  $J$ -( $n, \infty$ )-pure submodule of a strongly  $J$ - $n$ -injective module is strongly  $J$ - $n$ -injective.*

**Proof.** Let  $N$  be a  $J$ -( $n, \infty$ )-pure submodule of a strongly  $J$ - $n$ -injective right  $R$ -module  $M$ . For any  $n$ -generated small submodule  $T$  of a finitely generated free right  $R$ -module  $F$ , we have the exact sequence

$$\text{Hom}(F/T, M) \rightarrow \text{Hom}(F/T, M/N) \rightarrow \text{Ext}^1(F/T, N) \rightarrow \text{Ext}^1(F/T, M) = 0.$$

Since  $N$  is  $J$ -( $n, \infty$ )-pure in  $M$ , by Lemma 2.1, the sequence

$$\text{Hom}(F/T, M) \rightarrow \text{Hom}(F/T, M/N) \rightarrow 0$$

is exact. Hence  $\text{Ext}^1(F/T, N) = 0$ , and so  $N$  is strongly  $J$ - $n$ -injective. □

**Theorem 2.6.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is right strongly  $J$ - $n$ -injective.
- (2) Every finitely generated small submodule  $T$  of the left  $R$ -module  $R^n$  is a left annihilator of a subset  $X$  of  $R_n$ .
- (3) If  $\mathfrak{r}_{R^n}(T) \subseteq \mathfrak{r}_{R^n}(\alpha)$  for a finitely generated small submodule  $T$  of the left  $R$ -module  $R^n$  and  $\alpha \in R^n$ , then  $\alpha \in T$ .
- (4)  $R^n/T$  is a torsionless left  $R$ -module for every finitely generated small submodule  $T$  of  $R^n$ .
- (5)  $\mathbf{l}_{R^n} \mathfrak{r}_{R^n}(T) = T$  for every finitely generated small submodule  $T$  of the left  $R$ -module  $R^n$ .

**Proof.** (1)  $\Rightarrow$  (2) follows from Theorem 2.4(4).

(2)  $\Leftrightarrow$  (4)  $\Leftrightarrow$  (5) follows from [22, Lemma 2.3].

(5)  $\Rightarrow$  (3) If  $\mathfrak{r}_{R^n}(T) \subseteq \mathfrak{r}_{R^n}(\alpha)$ , then  $\alpha \in \mathbf{l}_{R^n} \mathfrak{r}_{R^n}(\alpha) \subseteq \mathbf{l}_{R^n} \mathfrak{r}_{R^n}(T) = T$  by (5).

(3)  $\Rightarrow$  (1) Let  $F = (R_R)^m, K = \beta_1 R + \cdots + \beta_n R$  be an  $n$ -generated small submodule of  $F$ , and  $f$  be a right  $R$ -homomorphism from  $K$  to  $R$ . Write

$$\begin{aligned} \beta_j &= (b_{1j}, \dots, b_{mj}), \quad j = 1, \dots, n; \\ \alpha_i &= (b_{i1}, \dots, b_{in}), \quad i = 1, \dots, m; \\ \alpha &= (f(\beta_1), \dots, f(\beta_n)); \\ T &= R\alpha_1 + \cdots + R\alpha_m. \end{aligned}$$

Then  $T$  is a small submodule of the left  $R$ -module  $R^n$  and  $\mathfrak{r}_{R^n}(T) \subseteq \mathfrak{r}_{R^n}(\alpha)$ . By (3),  $\alpha \in T$ , so  $\alpha = c_1\alpha_1 + \cdots + c_m\alpha_m$  for some  $c_1, \dots, c_m \in R$ . Now we

define  $g : F \rightarrow R; (r_1, \dots, r_m) \mapsto c_1 r_1 + \dots + c_m r_m$ , then it is easy to check that  $f(\beta_j) = g(\beta_j), j = 1, \dots, n$ , and therefore  $g$  extends  $f$ .  $\square$

Recall that a ring  $R$  is called *semiregular* [11] if for any  $a \in R$ , there exists  $e^2 = e \in aR$  such that  $(1 - e)a \in J(R)$ . By [11, Theorem B.44],  $R$  is semiregular if and only if  $R/J(R)$  is regular and idempotents lift modulo  $J(R)$ . A right  $R$ -module  $M$  is called *semiregular* if for any  $m \in M$ , we have  $M = P \oplus K$ , where  $P$  is projective,  $P \subseteq mR$ , and  $mR \cap K$  is small in  $K$ . It is easy to see that a ring  $R$  is semiregular if and only if the right  $R$ -module  $R_R$  is semiregular. By [11, Theorem B.51], a module  $M$  is semiregular if and only if, for any finitely generated submodule  $N$  of  $M$ , we have  $M = P \oplus K$ , where  $P$  is projective,  $P \subseteq N$ , and  $N \cap K$  is small in  $K$ ; and by [11, Theorem B.54], direct sums and direct summands of semiregular modules are semiregular. We recall also that a right  $R$ -module  $M$  is called *strongly  $n$ -injective* [22] if every  $R$ -homomorphism from an  $n$ -generated submodule of a free right  $R$ -module  $F$  to  $M$  extends to a homomorphism of  $F$  to  $M$ .

**Proposition 2.7.** *If  $R$  is a semiregular ring, then a right  $R$ -module  $M$  is strongly  $n$ -injective if and only if it is strongly  $J$ - $n$ -injective.*

**Proof.** Necessity is clear. To prove the sufficiency, let  $N$  be an  $n$ -generated submodule of a finitely generated free right  $R$ -module  $F$  and  $f : N \rightarrow M$  be a right  $R$ -homomorphism. Since  $R$  is semiregular, by [11, Lemma B.54],  $F$  is semiregular. So, by [11, Lemma B.51],  $F = P \oplus K$ , where  $P$  is projective,  $P \subseteq N$  and  $N \cap K$  is small in  $K$ . Hence  $F = N + K$ ,  $N = P \oplus (N \cap K)$ , and so  $N \cap K$  is  $n$ -generated and small in  $F$ . Since  $M$  is  $J$ - $n$ -injective, there exists a homomorphism  $g : F \rightarrow M$  such that  $g(x) = f(x)$  for all  $x \in N \cap K$ . Now let  $h : F \rightarrow M; x \mapsto f(n) + g(k)$ , where  $x = n + k, n \in N, k \in K$ . Then  $h$  is a well-defined left  $R$ -homomorphism and  $h$  extends  $f$ .  $\square$

### 3. Strongly $J$ - $n$ -flat modules

Recall that a right  $R$ -module  $V$  is said to be  *$n$ -flat* [13,7], if for every  $n$ -generated left ideal  $T$  of  $R$ , the canonical map  $V \otimes T \rightarrow V \otimes R$  is monic; a right  $R$ -module  $V$  is said to be  *$J$ -flat* [6], if for every finitely generated left ideal  $T$  in  $J(R)$ , the canonical map  $V \otimes T \rightarrow V \otimes R$  is monic; a right  $R$ -module  $V$  is said to be  *$J$ - $n$ -flat* [20], if for every  $n$ -generated left ideal  $T$  in  $J(R)$ , the canonical map  $V \otimes T \rightarrow V \otimes R$  is monic. Inspired by these concepts, we introduce the concepts of *strongly  $J$ - $n$ -flat modules* and *strongly  $J$ -flat modules* as follows.

**Definition 3.1.** A right  $R$ -module  $V$  is said to be strongly  $J$ - $n$ -flat, if for every  $n$ -generated small submodule  $T$  of a free left  $R$ -module  $F$ , the canonical map  $V \otimes T \rightarrow V \otimes F$  is monic. A right  $R$ -module  $V$  is said to be strongly  $J$ -flat if it is strongly  $J$ - $n$ -flat for every positive integer  $n$ .

**Theorem 3.2.** For a right  $R$ -module  $V$ , the following statements are equivalent:

- (1)  $V$  is strongly  $J$ - $n$ -flat.
- (2)  $\text{Tor}_1(V, F/L) = 0$  for every finitely generated free left  $R$ -module  $F$  and any  $n$ -generated small submodule  $L$  of  $F$ .
- (3)  $\text{Tor}_1(V, F/L) = 0$  for every free left  $R$ -module  $F$  and any  $n$ -generated small submodule  $L$  of  $F$ .
- (4)  $V^+$  is strongly  $J$ - $n$ -injective.
- (5) If the sequence of right  $R$ -modules  $0 \rightarrow U' \rightarrow U \rightarrow V \rightarrow 0$  is exact, then  $U'$  is  $J$ - $(\infty, n)$ -pure in  $U$ .
- (6) For every finitely generated small submodule  $T$  of the right  $R$ -module  $R^n$  and any homomorphism  $f : R^n/T \rightarrow V$ ,  $f$  factors through a finitely generated free right  $R$ -module  $F$ , that is, there exist a homomorphism  $g : R^n/T \rightarrow F$  and a homomorphism  $h : F \rightarrow V$  such that  $f = hg$ .
- (7) For every finitely generated small submodule  $T$  of the right  $R$ -module  $R^n$  and any homomorphism  $f : R^n/T \rightarrow V$ ,  $f$  factors through a finitely generated projective right  $R$ -module  $P$ .
- (8) For every finitely generated small submodule  $T$  of the right  $R$ -module  $R^n$ , if  $g : M \rightarrow V$  is an epimorphism, then for any homomorphism  $f : R^n/T \rightarrow V$ , there exists a homomorphism  $h : R^n/T \rightarrow M$  such that  $f = gh$ .

**Proof.** (1)  $\Leftrightarrow$  (2) follows from the exact sequence  $0 \rightarrow \text{Tor}_1(V, F/L) \rightarrow V \otimes L \rightarrow V \otimes F$ .

(2)  $\Leftrightarrow$  (3), and (6)  $\Leftrightarrow$  (7) are obvious.

(2)  $\Leftrightarrow$  (4) follows from the isomorphism  $\text{Tor}_1(M, F/L)^+ \cong \text{Ext}^1(F/L, M^+)$ .

(2)  $\Rightarrow$  (5) Let  $0 \rightarrow U' \rightarrow U \rightarrow V \rightarrow 0$  be an exact sequence of right  $R$ -modules. By (2), the canonical map  $U' \otimes F/L \rightarrow U \otimes F/L$  is monic for any finitely generated free left  $R$ -module  $F$  and any  $n$ -generated small submodule  $L$  of  $F$ , and so  $U'$  is  $J$ - $(\infty, n)$ -pure in  $U$ .

(5)  $\Rightarrow$  (2) Let  $0 \rightarrow K \rightarrow F_1 \rightarrow V \rightarrow 0$  be an exact sequence of right  $R$ -modules, where  $F_1$  is free. Then by (5),  $K$  is  $J$ - $(\infty, n)$ -pure in  $F_1$ . So it follows from the exact sequence

$$0 = \text{Tor}_1^R(F_1, F/L) \rightarrow \text{Tor}_1^R(V, F/L) \rightarrow K \otimes F/L \rightarrow F_1 \otimes F/L$$

that  $\text{Tor}_1^R(V, F/L) = 0$  for every finitely generated free left  $R$ -module  $F$  and any  $n$ -generated small submodule  $L$  of  $F$ .

(5)  $\Rightarrow$  (6) Let  $0 \rightarrow K \rightarrow F_1 \rightarrow V \rightarrow 0$  be an exact sequence of right  $R$ -modules, where  $F_1$  is free. Then by (5),  $K$  is  $J$ - $(\infty, n)$ -pure in  $F_1$ . And so, by Lemma 2.2, we have that the canonical map  $\text{Hom}(R^n/T, F_1) \rightarrow \text{Hom}(R^n/T, V)$  is surjective for any finitely generated small submodule  $T$  of  $R_R^n$ . This follows that  $f$  factors through a finitely generated free right  $R$ -module  $F$  since  $R^n/T$  is finitely generated.

(6)  $\Rightarrow$  (5) Let  $0 \rightarrow U' \rightarrow U \xrightarrow{\pi} V \rightarrow 0$  be an exact sequence of right  $R$ -modules with  $U$   $J$ - $n$ -flat. Then for any finitely generated small submodule  $T$  of  $R_R^n$  and any homomorphism  $f : R^n/T \rightarrow V$ , by (6), there exist a finitely generated free module  $F$ , two homomorphisms  $g \in \text{Hom}_R(R^n/T, F)$  and  $h \in \text{Hom}_R(F, V)$  such that  $f = hg$ . Since  $F$  is projective, there exists a homomorphism  $\alpha : F \rightarrow U$  such that  $h = \pi\alpha$ . Thus,  $\alpha g$  is a homomorphism from  $R^n/T$  to  $U$  and  $f = \pi(\alpha g)$ . So, the canonical map  $\text{Hom}_R(R^n/T, U) \rightarrow \text{Hom}_R(R^n/T, V)$  is surjective, and then the canonical map  $\text{Hom}_R(R^n/T, U) \rightarrow \text{Hom}_R(R^n/T, U/U')$  is surjective. By Lemma 2.2,  $U'$  is  $J$ - $(\infty, n)$ -pure in  $U$ .

(7)  $\Rightarrow$  (8) Let  $g : M \rightarrow V$  be an epimorphism and  $f : R^n/T \rightarrow V$  be any homomorphism, where  $T$  is a finitely generated small submodule of  $R^n$ . By (7),  $f$  factors through a finitely generated projective right  $R$ -module  $P$ , i.e., there exist  $\varphi : R^n/T \rightarrow P$  and  $\psi : P \rightarrow V$  such that  $f = \psi\varphi$ . Since  $P$  is projective, there exists a homomorphism  $\theta : P \rightarrow M$  such that  $\psi = g\theta$ . Now write  $h = \theta\varphi$ , then  $h$  is a homomorphism from  $R^n/T$  to  $M$ , and  $f = \psi\varphi = g(\theta\varphi) = gh$ . And so (8) follows.

(8)  $\Rightarrow$  (7) Let  $F_1$  be a free module and  $\pi : F_1 \rightarrow V$  be an epimorphism. By (8), there exists a homomorphism  $g : R^n/T \rightarrow F_1$  such that  $f = \pi g$ . Note that  $\text{Im}(g)$  is finitely generated, so there is a finitely generated free module  $F$  such that  $\text{Im}(g) \subseteq F \subseteq F_1$ . Let  $\iota : F \rightarrow F_1$  be the inclusion map and  $h = \pi\iota$ . Then  $h$  is a homomorphism from  $F$  to  $V$  and  $f = hg$ .  $\square$

**Corollary 3.3.** *For a right  $R$ -module  $V$ , the following statements are equivalent:*

- (1)  $V$  is strongly  $J$ -flat.
- (2)  $\text{Tor}_1(V, F/L) = 0$  for every finitely generated free left  $R$ -module  $F$  and any finitely generated small submodule  $L$  of  $F$ .
- (3)  $\text{Tor}_1(V, F/L) = 0$  for every free left  $R$ -module  $F$  and any finitely generated small submodule  $L$  of  $F$ .
- (4)  $V^+$  is  $J$ -FP-injective.
- (5) If the sequence of right  $R$ -modules  $0 \rightarrow U' \rightarrow U \rightarrow V \rightarrow 0$  is exact, then  $U'$  is  $J$ -pure in  $U$ .

- (6) For every finitely generated small submodule  $T$  of a finitely generated free right  $R$ -module  $F$ , any homomorphism  $f : F/T \rightarrow V$  factors through a finitely generated free right  $R$ -module  $F_1$ , that is, there exist a homomorphism  $g : F/T \rightarrow F_1$  and a homomorphism  $h : F_1 \rightarrow V$  such that  $f = hg$ .
- (7) For every finitely generated small submodule  $T$  of a free right  $R$ -module  $F$ , any homomorphism  $f : F/T \rightarrow V$  factors through a finitely generated projective right  $R$ -module  $P$ .
- (8) For every finitely generated small submodule  $T$  of a free right  $R$ -module  $F$ , if  $g : M \rightarrow V$  is an epimorphism, then for any homomorphism  $f : F/T \rightarrow V$ , there exists a homomorphism  $h : F/T \rightarrow M$  such that  $f = gh$ .

**Proposition 3.4.** *Every  $J$ - $(n, \infty)$ -pure submodule of a strongly  $J$ - $n$ -flat module is strongly  $J$ - $n$ -flat.*

**Proof.** Suppose that  $V_R$  is strongly  $J$ - $n$ -flat,  $K$  is  $J$ - $(n, \infty)$ -pure in  $V$ . Let  $X \in K^n$ ,  $A \in J^{n \times m}$  satisfy  $XA = 0$ . Then by the strongly  $J$ - $n$ -flatness of  $V$ , there exist positive integer  $l$ ,  $U \in V^l$  and  $C \in R^{l \times n}$  such that  $CA = 0$  and  $X = UC$ . Since  $K$  is  $J$ - $(n, \infty)$ -pure in  $V$  and hence  $J$ - $(n, l)$ -pure, by [21, Theorem 2.4(3)], we have  $X = YC$  for some  $Y \in K^l$ . So  $K$  is  $J$ - $(m, n)$ -flat for any positive integer  $m$  by [21, Theorem 4.2(5)], and hence  $K$  is strongly  $J$ - $n$ -flat.  $\square$

**Corollary 3.5.** *Every  $J$ -pure submodule of a strongly  $J$ -flat module is strongly  $J$ -flat.*

**Remark 3.6.** From Theorem 3.2, the strongly  $J$ - $n$ -flatness of  $V_R$  can be characterized by the strongly  $J$ - $n$ -injectivity of  $V^+$ . On the other hand, by [5, Lemma 2.7(1)], the sequence  $\text{Tor}_1(V^+, M) \rightarrow \text{Ext}^1(M, V)^+ \rightarrow 0$  is exact for all finitely presented left  $R$ -module  $M$ , so if  $V^+$  is strongly  $J$ - $n$ -flat, then  $V$  is strongly  $J$ - $n$ -injective.

**Proposition 3.7.** *If  $R$  is a semiregular ring, then a left  $R$ -module  $M$  is strongly  $n$ -flat if and only if it is strongly  $J$ - $n$ -flat.*

**Proof.** Theorem 3.2(4), Proposition 2.7 and [22, Theorem 3.1(4)] give the desired result.  $\square$

#### 4. Strongly $J$ - $n$ -coherent rings

Recall that a ring  $R$  is called *left  $(m, n)$ -coherent* [17] if every  $n$ -generated submodule of  $R^m$  is finitely presented; a ring  $R$  is called *left  $J$ -coherent* [6] if every finitely generated left ideal in  $J(R)$  is finitely presented; a ring  $R$  is called *left  $J$ - $n$ -coherent* [20] if every  $n$ -generated left ideal in  $J(R)$  is finitely presented. Inspired

by these concepts, we introduce the concepts of strongly  $J$ - $n$ -coherent rings and  $J$ - $(m, n)$ -coherent rings as follows.

**Definition 4.1.** A ring  $R$  is called left strongly  $J$ - $n$ -coherent if every  $n$ -generated small submodule of a free left  $R$ -module is finitely presented. A ring  $R$  is called left  $J$ - $(m, n)$ -coherent if every  $n$ -generated small submodule of  ${}_R R^m$  is finitely presented.

Recall that a left  $R$ -module  $A$  is called 2-presented if there exists an exact sequence  $F_2 \rightarrow F_1 \rightarrow F_0 \rightarrow A \rightarrow 0$  in which every  $F_i$  is a finitely generated free module. It is easy to see that a ring  $R$  is left strongly  $J$ - $n$ -coherent if and only if it is left  $J$ - $(m, n)$ -coherent for all positive integers  $m$ , if and only if every  $J$ - $(m, n)$ -presented left  $R$ -module is 2-presented for all positive integers  $m$ .

**Theorem 4.2.** *Let  $R$  be a ring. Then the following statements are equivalent:*

- (1)  $R$  is a left  $J$ -coherent ring.
- (2) Every finitely generated small submodule  $A$  of a finitely generated free left  $R$ -module  $F$  is finitely presented.
- (3) Every finitely generated small submodule  $A$  of a free left  $R$ -module  $F$  is finitely presented.
- (4) Every finitely generated small submodule  $A$  of a projective left  $R$ -module  $F$  is finitely presented.
- (5) For every finitely generated free left  $R$ -module  $F$  and any finitely generated small submodule  $A$  of  $F$ ,  $F/A$  is 2-presented.

**Proof.** (1)  $\Rightarrow$  (2) Let  $F = R^m$ . We prove by induction on  $m$ . If  $m = 1$ , then  $A$  is a finitely generated left ideal in  $J(R)$ , by hypothesis,  $A$  is finitely presented. Assume that every finitely generated small submodule of the left  $R$ -module  $R^{m-1}$  is finitely presented. Then for any finitely generated small submodule  $A$  of the left  $R$ -module  $R^m$ , let  $B = A \cap (Re_1 \oplus \cdots \oplus Re_{m-1})$ , where  $e_j \in R^m$  with 1 in the  $j$ th position and 0's in all other positions. Then each  $a \in A$  has a unique expression  $a = b + re_m$ , where  $b \in (J(R))^{m-1} \oplus 0, r \in J(R)$ . If  $\varphi : A \rightarrow R$  is defined by  $a \mapsto r$ , then there is an exact sequence  $0 \rightarrow B \rightarrow A \xrightarrow{\varphi} L \rightarrow 0$ , where  $L = \text{Im}(\varphi)$  is a finitely generated left ideal in  $J(R)$ . By hypothesis,  $L$  is finitely presented, and so  $B$  is finitely presented. Since  $B$  is isomorphic to a small submodule of  $R^{m-1}$ , the induction hypothesis gives  $B$  is finitely presented. Therefore,  $A$  is also finitely presented by [16, 25.1(2)(ii)].

(2)  $\Rightarrow$  (1), and (2)  $\Leftrightarrow$  (3)  $\Leftrightarrow$  (4), as well as (2)  $\Rightarrow$  (5) are obvious. □

**Remark 4.3.** By Theorem 4.2, it is easy to see that  $R$  is left  $J$ -coherent if and only if  $R$  is left strongly  $J$ - $n$ -coherent for each positive integer  $n$ .

**Theorem 4.4.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is left strongly  $J$ - $n$ -coherent.
- (2) If  $0 \rightarrow K \xrightarrow{f} R^n \xrightarrow{g} T$  is an exact sequence of left  $R$ -modules, where  $T$  is a finitely generated small submodule of a free left  $R$ -module, then  $K$  is finitely generated.
- (3)  $\mathbf{1}_{R^n}(X)$  is a finitely generated submodule of  ${}_R R^n$  for any finite subset  $X$  of  $J_n$ .
- (4) For any finitely generated small submodule  $S$  of the right  $R$ -module  $R_n$ , the dual module  $(R_n/S)^*$  is a finitely generated left  $R$ -module.

**Proof.** (1)  $\Rightarrow$  (2) Since  $R$  is left strongly  $J$ - $n$ -coherent and  $\text{im}(g)$  is an  $n$ -generated small submodule of a free left  $R$ -module,  $\text{im}(g)$  is finitely presented. Noting that the sequence  $0 \rightarrow \ker(g) \rightarrow R^n \rightarrow \text{im}(g) \rightarrow 0$  is exact, we have that  $\ker(g)$  is finitely generated. Thus  $K \cong \text{im}(f) = \ker(g)$  is finitely generated.

(2)  $\Rightarrow$  (3) Let  $X = \{\alpha_1, \dots, \alpha_m\}$ . Then we have an exact sequence of left  $R$ -modules  $0 \rightarrow \mathbf{1}_{R^n}(X) \rightarrow R^n \xrightarrow{g} J^m$ , where  $g(\beta) = (\beta\alpha_1, \dots, \beta\alpha_m)$ . By (2),  $\mathbf{1}_{R^n}(X)$  is a finitely generated left  $R$ -module.

(3)  $\Rightarrow$  (1) Let  $T = Rt_1 + \dots + Rt_n$  be an  $n$ -generated small submodule of  $R_m$ , where  $t_j = (a_{1j}, \dots, a_{mj})'$ ,  $j = 1, \dots, n$ . Write  $\alpha_i = (a_{i1}, \dots, a_{in})'$ ,  $i = 1, \dots, m$ ,  $X = \{\alpha_1, \dots, \alpha_m\}$ . Then we have an exact sequence of left  $R$ -modules  $0 \rightarrow \mathbf{1}_{R^n}(X) \rightarrow R^n \rightarrow T \rightarrow 0$ . By (3),  $\mathbf{1}_{R^n}(X)$  is finitely generated, so  $T$  is finitely presented.

(3)  $\Leftrightarrow$  (4) follows from [22, Lemma 4.1]. □

Let  $\mathcal{F}$  be a class of right  $R$ -modules and  $M$  a right  $R$ -module. Following [9], we say that a homomorphism  $\varphi : M \rightarrow F$  where  $F \in \mathcal{F}$  is an  $\mathcal{F}$ -preenvelope of  $M$  if for any morphism  $f : M \rightarrow F'$  with  $F' \in \mathcal{F}$ , there is a  $g : F \rightarrow F'$  such that  $g\varphi = f$ . An  $\mathcal{F}$ -preenvelope  $\varphi : M \rightarrow F$  is said to be an  $\mathcal{F}$ -envelope if every endomorphism  $g : F \rightarrow F$  such that  $g\varphi = \varphi$  is an isomorphism. Dually, we have the definitions of an  $\mathcal{F}$ -precover and an  $\mathcal{F}$ -cover.  $\mathcal{F}$ -envelopes ( $\mathcal{F}$ -covers) may not exist in general, but if they exist, they are unique up to isomorphism.

**Theorem 4.5.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is left strongly  $J$ - $n$ -coherent.

- (2)  $\varinjlim \text{Ext}^1(F/T, M_\alpha) \cong \text{Ext}^1(F/T, \varinjlim M_\alpha)$  for every  $n$ -generated small submodule  $T$  of a finitely generated free left  $R$ -module  $F$  and direct system  $(M_\alpha)_{\alpha \in A}$  of left  $R$ -modules.
- (3)  $\text{Tor}_1(\prod N_\alpha, F/T) \cong \prod \text{Tor}_1(N_\alpha, F/T)$  for any family  $\{N_\alpha\}$  of right  $R$ -modules and any  $n$ -generated small submodule  $T$  of a finitely generated free left  $R$ -module  $F$ .
- (4) Any direct product of copies of  $R_R$  is strongly  $J$ - $n$ -flat.
- (5) Any direct product of strongly  $J$ - $n$ -flat right  $R$ -modules is strongly  $J$ - $n$ -flat.
- (6) Any direct limit of strongly  $J$ - $n$ -injective left  $R$ -modules is strongly  $J$ - $n$ -injective.
- (7) Any direct limit of injective left  $R$ -modules is strongly  $J$ - $n$ -injective.
- (8) A left  $R$ -module  $M$  is strongly  $J$ - $n$ -injective if and only if  $M^+$  is strongly  $J$ - $n$ -flat.
- (9) A left  $R$ -module  $M$  is strongly  $J$ - $n$ -injective if and only if  $M^{++}$  is strongly  $J$ - $n$ -injective.
- (10) A right  $R$ -module  $M$  is strongly  $J$ - $n$ -flat if and only if  $M^{++}$  is strongly  $J$ - $n$ -flat.
- (11) For any ring  $S$ ,  $\text{Tor}_1(\text{Hom}_S(B, C), F/T) \cong \text{Hom}_S(\text{Ext}^1(F/T, B), C)$  for the situation  $({}_R(F/T), {}_R B_S, C_S)$  with  $F$  a finitely generated free left  $R$ -module and  $T$  an  $n$ -generated small submodule of  $F$  and  $C_S$  injective.
- (12) Every right  $R$ -module has a strongly  $J$ - $n$ -flat preenvelope.
- (13) For every finitely generated small submodule  $S$  of the right  $R$ -module  $R_n$ , the right  $R$ -module  $R_n/S$  has a finitely generated projective preenvelope.

**Proof.** (1)  $\Rightarrow$  (2) follows from [5, Lemma 2.9(2)].

(1)  $\Rightarrow$  (3) follows from [5, Lemma 2.10(2)].

(2)  $\Rightarrow$  (6)  $\Rightarrow$  (7), (3)  $\Rightarrow$  (5)  $\Rightarrow$  (4) are trivial.

(7)  $\Rightarrow$  (1) Let  $F$  be a finitely generated free left  $R$ -module and  $T$  be an  $n$ -generated small submodule of  $F$ , and let  $(E_\alpha)_{\alpha \in A}$  be a direct system of injective left  $R$ -modules (with  $A$  directed). Then  $\varinjlim E_\alpha$  is strongly  $J$ - $n$ -injective by (7), and so  $\text{Ext}^1(F/T, \varinjlim M_\alpha) = 0$ . Thus we have a commutative diagram with exact rows:

$$\begin{array}{ccccccc}
 \varinjlim \text{Hom}(F/T, E_\alpha) & \longrightarrow & \varinjlim \text{Hom}(F, E_\alpha) & \longrightarrow & \varinjlim \text{Hom}(T, E_\alpha) & \longrightarrow & 0 \\
 \downarrow f & & \downarrow g & & \downarrow h & & \\
 \text{Hom}(F/T, \varinjlim E_\alpha) & \longrightarrow & \text{Hom}(F, \varinjlim E_\alpha) & \longrightarrow & \text{Hom}(T, \varinjlim E_\alpha) & \longrightarrow & 0.
 \end{array}$$

Since  $f$  and  $g$  are isomorphism by [16, 25.4(d)],  $h$  is an isomorphisms by the Five Lemma. Now, let  $(M_\alpha)_{\alpha \in A}$  be any direct system of left  $R$ -modules (with  $A$  directed). Then we have a commutative diagram with exact rows:

$$\begin{array}{ccccccc} 0 & \longrightarrow & \varinjlim \text{Hom}(T, M_\alpha) & \longrightarrow & \varinjlim \text{Hom}(T, E(M_\alpha)) & \longrightarrow & \varinjlim \text{Hom}(T, E(M_\alpha)/M_\alpha) \\ & & \downarrow \phi_1 & & \downarrow \phi_2 & & \downarrow \phi_3 \\ 0 & \longrightarrow & \text{Hom}(T, \varinjlim M_\alpha) & \longrightarrow & \text{Hom}(T, \varinjlim E(M_\alpha)) & \longrightarrow & \text{Hom}(T, \varinjlim E(M_\alpha)/M_\alpha), \end{array}$$

where  $E(M_\alpha)$  is the injective hull of  $M_\alpha$ . Since  $T$  is finitely generated, by [16, 24.9], the maps  $\phi_1, \phi_2$  and  $\phi_3$  are monic. By the above proof,  $\phi_2$  is an isomorphism. Hence  $\phi_1$  is also an isomorphism by Five Lemma again, so  $T$  is finitely presented by [16, 25.4(d)] again. Therefore  $R$  is left strongly  $J$ - $n$ -coherent.

(4)  $\Rightarrow$  (1) Let  $T$  be an  $n$ -generated small submodule of a finitely generated free left  $R$ -module  $F$ . By (4),  $\text{Tor}_1(\Pi R, F/T) = 0$ . Thus we have a commutative diagram with exact rows:

$$\begin{array}{ccccccc} 0 & \longrightarrow & (\Pi R) \otimes T & \longrightarrow & (\Pi R) \otimes F & \longrightarrow & (\Pi R) \otimes F/T \longrightarrow 0 \\ & & \downarrow f_1 & & \downarrow f_2 & & \downarrow f_3 \\ 0 & \longrightarrow & \Pi T & \longrightarrow & \Pi F & \longrightarrow & \Pi(F/T) \longrightarrow 0. \end{array}$$

Since  $f_2$  and  $f_3$  are isomorphisms by [16, 25.4(g)],  $f_1$  is an isomorphism by the Five Lemma. So  $T$  is finitely presented by [16, 25.4(g)] again. Hence  $R$  is left strongly  $J$ - $n$ -coherent.

(5)  $\Rightarrow$  (12) Let  $N$  be any right  $R$ -module. By [9, Lemma 5.3.12], there is a cardinal number  $\aleph_\alpha$  dependent on  $\text{Card}(N)$  and  $\text{Card}(R)$  such that for any homomorphism  $f : N \rightarrow F$  with  $F$  strongly  $J$ - $n$ -flat, there is a pure submodule  $S$  of  $F$  such that  $f(N) \subseteq S$  and  $\text{Card } S \leq \aleph_\alpha$ . Thus  $f$  has a factorization  $N \rightarrow S \rightarrow F$  with  $S$  strongly  $J$ - $n$ -flat by Proposition 3.3. Now let  $\{\varphi_\beta\}_{\beta \in B}$  be all such homomorphisms  $\varphi_\beta : N \rightarrow S_\beta$  with  $\text{Card } S_\beta \leq \aleph_\alpha$  and  $S_\beta$  strongly  $J$ - $n$ -flat. Then any homomorphism  $N \rightarrow F$  with  $F$  strongly  $J$ - $n$ -flat has a factorization  $N \rightarrow S_i \rightarrow F$  for some  $i \in B$ . Thus the homomorphism  $N \rightarrow \Pi_{\beta \in B} S_\beta$  induced by all  $\varphi_\beta$  is a strongly  $J$ - $n$ -flat preenvelope since  $\Pi_{\beta \in B} S_\beta$  is strongly  $J$ - $n$ -flat by (5).

(12)  $\Rightarrow$  (5) follows from [4, Lemma 1].

(1)  $\Rightarrow$  (11) For any finitely generated free left  $R$ -module  $F$  and each  $n$ -generated small submodule  $T$  of  $F$ , since  $R$  is left strongly  $J$ - $n$ -coherent,  $F/T$  is 2-presented. And so (11) follows from [5, Lemma 2.7(2)].

(11)  $\Rightarrow$  (8) Let  $S = \mathbb{Z}, C = \mathbb{Q}/\mathbb{Z}$  and  $B = M$ . Then  $\text{Tor}_1(M^+, F/T) \cong \text{Ext}^1(F/T, M)^+$  for any  $n$ -generated small submodule  $T$  of a finitely generated free left  $R$ -module  $F$  by (11), and hence (8) holds.

(8)  $\Rightarrow$  (9) Let  $M$  be a left  $R$ -module. If  $M$  is strongly  $J$ - $n$ -injective, then  $M^+$  is strongly  $J$ - $n$ -flat by (8), and so  $M^{++}$  is strongly  $J$ - $n$ -injective by Theorem 3.2. Conversely, if  $M^{++}$  is strongly  $J$ - $n$ -injective, then  $M$ , being a pure submodule of  $M^{++}$  (see [15, Exercise 41, p.48]), is strongly  $J$ - $n$ -injective by Corollary 2.5.

(9)  $\Rightarrow$  (10) If  $M$  is a strongly  $J$ - $n$ -flat right  $R$ -module, then  $M^+$  is a strongly  $J$ - $n$ -injective left  $R$ -module by Theorem 3.2, and so  $M^{+++}$  is strongly  $J$ - $n$ -injective by (9). Thus  $M^{++}$  is strongly  $J$ - $n$ -flat by Theorem 3.2 again. Conversely, if  $M^{++}$  is strongly  $J$ - $n$ -flat, then  $M$  is strongly  $J$ - $n$ -flat by Corollary 3.3 as  $M$  is a pure submodule of  $M^{++}$ .

(10)  $\Rightarrow$  (5) Let  $\{N_\alpha\}_{\alpha \in A}$  be a family of strongly  $J$ - $n$ -flat right  $R$ -modules. Then  $\bigoplus_{\alpha \in A} N_\alpha$  is strongly  $n$ -flat, and so  $(\prod_{\alpha \in A} N_\alpha^+)^+ \cong (\bigoplus_{\alpha \in A} N_\alpha)^{++}$  is strongly  $n$ -flat by (10). Since  $\bigoplus_{\alpha \in A} N_\alpha^+$  is a pure submodule of  $\prod_{\alpha \in A} N_\alpha^+$  by [3, Lemma 1(1)],  $(\prod_{\alpha \in A} N_\alpha^+)^+ \rightarrow (\bigoplus_{\alpha \in A} N_\alpha^+)^+ \rightarrow 0$  splits, and hence  $(\bigoplus_{\alpha \in A} N_\alpha^+)^+$  is strongly  $J$ - $n$ -flat. Thus  $\prod_{\alpha \in A} N_\alpha^{++} \cong (\bigoplus_{\alpha \in A} N_\alpha^+)^+$  is strongly  $J$ - $n$ -flat. Since  $\prod_{\alpha \in A} N_\alpha$  is a pure submodule of  $\prod_{\alpha \in A} N_\alpha^{++}$  by [3, Lemma 1(2)],  $\prod_{\alpha \in A} N_\alpha$  is strongly  $J$ - $n$ -flat by Corollary 3.3.

(12)  $\Rightarrow$  (13) Let  $S$  be a finitely generated small submodule of the right  $R$ -module  $R_n$ . Then by (12),  $R_n/S$  has a strongly  $n$ -flat preenvelope  $f : R_n/S \rightarrow N$ . Since  $N$  is strongly  $n$ -flat, by Theorem 3.2, there exist a free right  $R$ -module  $F$ , a homomorphism  $g : R_n/S \rightarrow F$  and a homomorphism  $h : F \rightarrow N$  such that  $f = hg$ . Now let  $\alpha : R_n/S \rightarrow A$  be any right  $R$ -homomorphism. Then there exists a homomorphism  $\beta : N \rightarrow A$  such that  $\alpha = \beta f$ . So we have a homomorphism  $\beta h$  from  $F$  to  $A$  such that  $\alpha = (\beta h)g$ . Hence,  $g : R_n/S \rightarrow F$  is a finitely generated projective preenvelope of  $R_n/S$ .

(13)  $\Rightarrow$  (1) Let  $S$  be a finitely generated small submodule of the right  $R$ -module  $R_n$ . Then  $R_n/S$  has a finitely generated projective preenvelope  $f : R_n/S \rightarrow P$  by (13). So the sequence  $\text{Hom}(P, R) \rightarrow \text{Hom}(R_n/S, R) \rightarrow 0$  is exact, and hence  $(R_n/S)^* = \text{Hom}(R_n/S, R)$  is finitely generated since  $P$  is finitely generated and projective. Therefore, by Theorem 4.4,  $R$  is left strongly  $J$ - $n$ -coherent.  $\square$

**Corollary 4.6.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is left  $J$ -coherent.
- (2)  $\varinjlim \text{Ext}^1(F/T, M_\alpha) \cong \text{Ext}^1(F/T, \varinjlim M_\alpha)$  for every finitely generated small submodule  $T$  of a finitely generated free left  $R$ -module  $F$  and a direct system  $(M_\alpha)_{\alpha \in A}$  of left  $R$ -modules.

- (3)  $\text{Tor}_1(\prod N_\alpha, F/T) \cong \prod \text{Tor}_1(N_\alpha, F/T)$  for any family  $\{N_\alpha\}$  of right  $R$ -modules and any finitely generated small submodule  $T$  of a finitely generated free left  $R$ -module  $F$ .
- (4) Any direct product of copies of  $R_R$  is strongly  $J$ -flat.
- (5) Any direct product of strongly  $J$ -flat right  $R$ -modules is strongly  $J$ -flat.
- (6) Any direct limit of  $J$ -FP-injective left  $R$ -modules is  $J$ -FP-injective.
- (7) Any direct limit of injective left  $R$ -modules is  $J$ -FP-injective.
- (8) A left  $R$ -module  $M$  is  $J$ -FP-injective if and only if  $M^+$  is strongly  $J$ -flat.
- (9) A left  $R$ -module  $M$  is  $J$ -FP-injective if and only if  $M^{++}$  is  $J$ -FP-injective.
- (10) A right  $R$ -module  $M$  is strongly  $J$ -flat if and only if  $M^{++}$  is strongly  $J$ -flat.
- (11) For any ring  $S$ ,  $\text{Tor}_1(\text{Hom}_S(B, C), F/T) \cong \text{Hom}_S(\text{Ext}^1(F/T, B), C)$  for the situation  $({}_R(F/T), {}_R B_S, C_S)$  with  $F$  a finitely generated free left  $R$ -module and  $T$  a finitely generated small submodule of  $F$  and  $C_S$  injective.
- (12) Every right  $R$ -module has a strongly  $J$ -flat preenvelope.
- (13) For every finitely generated small submodule  $S$  of a finitely generated right  $R$ -module  $F$ , the right  $R$ -module  $F/S$  has a finitely generated projective preenvelope.

**Corollary 4.7.** *Let  $R$  be a semiregular ring. Then it is left strongly  $n$ -coherent if and only if it is left strongly  $J$ - $n$ -coherent.*

**Proof.** We need only to prove the sufficiency. Let  $R$  be left strongly  $J$ - $n$ -coherent. Then by Theorem 4.5(4), any direct product of copies of  $R_R$  is strongly  $J$ - $n$ -flat. Note that  $R$  is a semiregular ring, by Proposition 3.7, any direct product of copies of  $R_R$  is strongly  $n$ -flat. And so, by [22, Theorem 4.2(4)],  $R$  is left strongly  $n$ -coherent.  $\square$

**Corollary 4.8.** *Let  $R$  be a left strongly  $J$ - $n$ -coherent ring. Then every left  $R$ -module has a strongly  $J$ - $n$ -injective cover.*

**Proof.** Let  $0 \rightarrow A \rightarrow B \rightarrow C \rightarrow 0$  be a pure exact sequence of left  $R$ -modules with  $B$  strongly  $J$ - $n$ -injective. Then  $0 \rightarrow C^+ \rightarrow B^+ \rightarrow A^+ \rightarrow 0$  is split. Since  $R$  is left strongly  $J$ - $n$ -coherent,  $B^+$  is strongly  $J$ - $n$ -flat by Theorem 4.5(8), so  $C^+$  is strongly  $J$ - $n$ -flat, and hence  $C$  is strongly  $J$ - $n$ -injective by Remark 3.4. Thus, the class of strongly  $J$ - $n$ -injective modules is closed under pure quotients, and so by [10, Theorem 2.5], every left  $R$ -module has a strongly  $J$ - $n$ -injective cover.  $\square$

**Proposition 4.9.** *Let  $R$  be a left  $J$ -coherent ring. Then every left  $R$ -module has a  $J$ -FP-injective cover.*

**Proof.** It is similar to the proof of Corollary 4.8.  $\square$

**Corollary 4.10.** *The following are equivalent for a left strongly  $J$ - $n$ -coherent ring  $R$ :*

- (1) *Every strongly  $J$ - $n$ -flat right  $R$ -module is strongly  $J$ -flat.*
- (2) *Every strongly  $J$ - $n$ -injective left  $R$ -module is  $J$ -FP-injective.*

*In this case,  $R$  is left  $J$ -coherent.*

**Proof.** (1)  $\Rightarrow$  (2) Let  $M$  be any strongly  $J$ - $n$ -injective left  $R$ -module. Then  $M^+$  is strongly  $J$ - $n$ -flat by Theorem 4.5(8), and so  $M^+$  is strongly  $J$ -flat by (1). Thus  $M^{++}$  is  $J$ -FP-injective. Since  $M$  is a pure submodule of  $M^{++}$ , and a pure submodule of a  $J$ -FP-injective module is  $J$ -FP-injective,  $M$  is strongly  $J$ -FP-injective.

(2)  $\Rightarrow$  (1) Let  $M$  be a strongly  $J$ - $n$ -flat right  $R$ -module. Then  $M^+$  is a strongly  $J$ - $n$ -injective left  $R$ -module by Theorem 3.2, and so  $M^+$  is  $J$ -FP-injective by (2). Thus  $M$  is strongly  $J$ -flat.

In this case, any direct product of strongly  $J$ -flat right  $R$ -modules is strongly  $J$ -flat by Theorem 4.5(5), and so  $R$  is left  $J$ -coherent by Corollary 4.6.  $\square$

**Proposition 4.11.** *The following statements are equivalent for a ring  $R$ :*

- (1)  *$R$  is left strongly  $J$ - $n$ -coherent and  ${}_R R$  is strongly  $J$ - $n$ -injective.*
- (2) *Every right  $R$ -module has a monic strongly  $J$ - $n$ -flat preenvelope.*
- (3)  *$R$  is left strongly  $J$ - $n$ -coherent and every left  $R$ -module has an epic strongly  $J$ - $n$ -injective cover.*
- (4)  *$R$  is left strongly  $J$ - $n$ -coherent and every injective right  $R$ -module is strongly  $J$ - $n$ -flat.*
- (5)  *$R$  is left strongly  $J$ - $n$ -coherent and, for any finitely generated small submodule  $S$  of the right  $R$ -module  $R_n$ ,  $R_n/S$  embeds in a finitely generated free module.*
- (6)  *$R$  is left strongly  $J$ - $n$ -coherent and, for any finitely generated small submodule  $S$  of the right  $R$ -module  $R_n$ ,  $R_n/S$  has a monic finitely generated projective preenvelope.*
- (7)  *$R$  is left strongly  $J$ - $n$ -coherent and every flat left  $R$ -module is strongly  $J$ - $n$ -injective.*

**Proof.** (1) $\Rightarrow$ (2) Let  $M$  be any right  $R$ -module. Then  $M$  has a strongly  $J$ - $n$ -flat preenvelope  $f : M \rightarrow F$  by Theorem 4.5(12). Since  $({}_R R)^+$  is a cogenerator, there exists an exact sequence  $0 \rightarrow M \xrightarrow{g} \prod ({}_R R)^+$ . Since  ${}_R R$  is strongly  $J$ - $n$ -injective, by Theorem 4.5,  $\prod ({}_R R)^+$  is strongly  $J$ - $n$ -flat, and so there exists a right  $R$ -homomorphism  $h : F \rightarrow \prod ({}_R R)^+$  such that  $g = hf$ , which shows that  $f$  is monic.

(2) $\Rightarrow$ (4) Assume (2) holds. Then  $R$  is left strongly  $J$ - $n$ -coherent by Theorem 4.5(12). Now, let  $E$  be an injective right  $R$ -module  $E$ . Then  $E$  has a monic strongly  $J$ - $n$ -flat preenvelope  $F$ , so  $E$  is isomorphic to a direct summand of  $F$ , and thus  $E$  is strongly  $J$ - $n$ -flat.

(4) $\Rightarrow$ (1) Since  $({}_R R)^+$  is injective, by (4), it is strongly  $J$ - $n$ -flat. Thus  ${}_R R$  is strongly  $J$ - $n$ -injective by Theorem 4.5(8).

(1) $\Rightarrow$ (3) Let  $M$  be a left  $R$ -module. Then  $M$  has a strongly  $J$ - $n$ -injective cover  $\varphi : C \rightarrow M$  by Corollary 4.8. On the other hand, there is an exact sequence  $F \xrightarrow{\alpha} M \rightarrow 0$  with  $F$  free. Since  ${}_R R$  is strongly  $J$ - $n$ -injective by (1),  $F$  is strongly  $J$ - $n$ -injective, so there exists a homomorphism  $\beta : F \rightarrow C$  such that  $\alpha = \varphi\beta$ . This follows that  $\varphi$  is epic.

(3) $\Rightarrow$ (1) Let  $f : N \rightarrow {}_R R$  be an epic strongly  $J$ - $n$ -injective cover. Then the projectivity of  ${}_R R$  implies that  ${}_R R$  is isomorphic to a direct summand of  $N$ , and so  ${}_R R$  is strongly  $J$ - $n$ -injective.

(1) $\Rightarrow$ (5) Let  $S$  be any finitely generated small submodule of the right  $R$ -module  $R_n$ . Since  ${}_R R$  is strongly  $J$ - $n$ -injective, by Theorem 2.6(4),  $M$  is torsionless. Note that  $R$  is left strongly  $J$ - $n$ -coherent, by Theorem 4.6(4),  $R_n/S$  embeds in a strongly  $J$ - $n$ -flat right  $R$ -module  $V$ . And so  $R_n/S$  embeds in a finitely generated free right  $R$ -module  $F$  by Theorem 3.2(6).

(5) $\Rightarrow$ (1) It follows from Theorem 2.6(4).

(2) $\Rightarrow$ (6) Clearly,  $R$  is left strongly  $J$ - $n$ -coherent. Let  $S$  be any finitely generated small submodule of the right  $R$ -module  $R_n$ . By (2),  $R_n/S$  has a monic strongly  $J$ - $n$ -flat preenvelope  $f : R_n/S \rightarrow V$ . And so, by Theorem 3.2(6),  $f$  factors through a finitely generated free right  $R$ -module  $F$ , that is, there exist a homomorphism  $g : R_n/S \rightarrow F$  and a homomorphism  $h : F \rightarrow V$  such that  $f = hg$ . Now let  $P$  be a projective right  $R$ -module and  $\varphi$  be a homomorphism from  $R_n/S$  to  $P$ . Then there exists a homomorphism  $\theta : V \rightarrow P$  such that  $\varphi = \theta f$ . Thus,  $\theta h$  is a homomorphism from  $F$  to  $P$  and  $\varphi = (\theta h)g$ . Therefore,  $g : R_n/S \rightarrow F$  is a monic finitely generated projective preenvelope of  $R_n/S$ .

(6) $\Rightarrow$ (1) It follows from Theorem 2.6(4).

(4) $\Rightarrow$ (7) Let  $M$  be a flat left  $R$ -module. Then  $M^+$  is injective, and so  $M^+$  is strongly  $J$ - $n$ -flat by (4). Hence  $M$  is strongly  $J$ - $n$ -injective by Theorem 4.5(8).

(7) $\Rightarrow$ (1) It is obvious. □

**Proposition 4.12.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is left  $J$ -coherent and  ${}_R R$  is  $J$ -FP-injective.
- (2) Every right  $R$ -module has a monic strongly  $J$ -flat preenvelope.

- (3)  $R$  is left  $J$ -coherent and every left  $R$ -module has an epic  $J$ -FP-injective cover.
- (4)  $R$  is left  $J$ -coherent and every injective right  $R$ -module is strongly  $J$ -flat.
- (5)  $R$  is left  $J$ -coherent and, for any finitely generated small submodule  $S$  of a finitely generated free right  $R$ -module  $F$ ,  $F/S$  embeds in a finitely generated free module.
- (6)  $R$  is left  $J$ -coherent and, for any finitely generated small submodule  $S$  of a finitely generated free right  $R$ -module  $F$ ,  $F/S$  has a monic finitely generated projective preenvelope.
- (7)  $R$  is left  $J$ -coherent and every flat left  $R$ -module is  $J$ -FP-injective.

**Proof.** It is similar to the proof of Proposition 4.11. □

**Theorem 4.13.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is left strongly  $J$ - $n$ -coherent.
- (2)  $\text{Ext}_R^1(T, N) = 0$  for any  $n$ -generated small submodule  $T$  of a free left  $R$ -module  $F$  and any FP-injective left  $R$ -module  $N$ .
- (3)  $\text{Ext}_R^2(F/T, N) = 0$  for any finitely generated free left  $R$ -module  $F$  and its  $n$ -generated small submodule  $T$  and any FP-injective left  $R$ -module  $N$ .
- (4) If  $N$  is a strongly  $J$ - $n$ -injective left  $R$ -module,  $N_1$  is an FP-injective submodule of  $N$ , then  $N/N_1$  is strongly  $J$ - $n$ -injective.
- (5) For any FP-injective left  $R$ -module  $N$ ,  $E(N)/N$  is strongly  $J$ - $n$ -injective.

**Proof.** (1)  $\Rightarrow$  (2) and (4)  $\Rightarrow$  (5) are obvious.

(2)  $\Rightarrow$  (3) It follows from the isomorphism  $\text{Ext}_R^2(F/T, N) \cong \text{Ext}_R^1(T, N)$ .

(3)  $\Rightarrow$  (4) Let  $F$  be a finitely generated free left  $R$ -module and  $T$  its  $n$ -generated small submodule. The exact sequence  $0 \rightarrow N_1 \rightarrow N \rightarrow N/N_1 \rightarrow 0$  induces the exactness of the sequence

$$0 = \text{Ext}^1(F/T, N) \rightarrow \text{Ext}^1(F/T, N/N_1) \rightarrow \text{Ext}^2(F/T, N_1) = 0.$$

Therefore  $\text{Ext}^1(F/T, N/N_1) = 0$ , as desired.

(5)  $\Rightarrow$  (1) Let  $F$  be a finitely generated free left  $R$ -module and  $T$  its  $n$ -generated small submodule. Then for any FP-injective module  $N$ ,  $E(N)/N$  is strongly  $J$ - $n$ -injective by (5). From the exactness of the two sequences

$$0 = \text{Ext}^1(F, N) \rightarrow \text{Ext}^1(T, N) \rightarrow \text{Ext}^2(F/T, N) \rightarrow \text{Ext}^2(F, N) = 0$$

and

$$0 = \text{Ext}^1(F/T, E(N)) \rightarrow \text{Ext}^1(F/T, E(N)/N) \rightarrow \text{Ext}^2(F/T, N) \rightarrow \text{Ext}^2(F/T, E(N)) = 0,$$

we have

$$\text{Ext}^1(T, N) \cong \text{Ext}^2(F/T, N) \cong \text{Ext}^1(F/T, E(N)/N) = 0,$$

so  $\text{Ext}^1(T, N) = 0$ . By [8],  $T$  is finitely presented. Therefore,  $R$  is left strongly  $J$ - $n$ -coherent.  $\square$

**Corollary 4.14.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is left  $J$ -coherent.
- (2)  $\text{Ext}_R^1(T, N) = 0$  for any finitely generated small submodule  $T$  of a free left  $R$ -module  $F$  and any FP-injective left  $R$ -module  $N$ .
- (3)  $\text{Ext}_R^2(F/T, N) = 0$  for any finitely generated free left  $R$ -module  $F$  and its finitely generated small submodule  $T$  and any FP-injective left  $R$ -module  $N$ .
- (4) If  $N$  is a  $J$ -FP-injective left  $R$ -module,  $N_1$  is an FP-injective submodule of  $N$ , then  $N/N_1$  is  $J$ -FP-injective.
- (5) For any FP-injective left  $R$ -module  $N$ ,  $E(N)/N$  is  $J$ -FP-injective.

## 5. $J$ - $n$ -semihereditary rings

**Definition 5.1.** A ring  $R$  is said to be left  $J$ - $n$ -semihereditary if every  $n$ -generated small left ideal of  $R$  is projective.

**Theorem 5.2.** *Let  $R$  be a ring. Then the following statements are equivalent:*

- (1)  $R$  is a left  $J$ - $n$ -semihereditary ring.
- (2) Every  $n$ -generated small submodule  $A$  of a finitely generated free left  $R$ -module  $F$  is projective.
- (3) Every  $n$ -generated small submodule  $A$  of a free left  $R$ -module is projective.
- (4) If  $0 \rightarrow K \rightarrow P \rightarrow V \rightarrow 0$  is exact, where  $V$  is a  $J$ -finitely presented left  $R$ -module and  $P$  is projective, then  $K$  is projective.

**Proof.** (1)  $\Rightarrow$  (2) Let  $F = R^m$ . We prove by induction on  $m$ . If  $m = 1$ , then  $A$  is an  $n$ -generated small left ideal of  $R$ , by (1),  $A$  is projective. Assume that every  $n$ -generated small submodule of the left  $R$ -module  $R^{m-1}$  is projective. Then for any  $n$ -generated small submodule  $A$  of the left  $R$ -module  $R^m$ , let  $B = A \cap (Re_1 \oplus \cdots \oplus Re_{m-1})$ , where  $e_j \in R^m$  with 1 in the  $j$ th position and 0's in all other positions. Then each  $a \in A$  has a unique expression  $a = b + re_m$ , where  $b \in J(R)^{m-1}$ ,  $r \in J(R)$ . If  $\varphi : A \rightarrow R$  is defined by  $a \mapsto r$ , then there is an exact sequence  $0 \rightarrow B \rightarrow A \xrightarrow{\varphi} L \rightarrow 0$ , where  $L = \text{Im}(\varphi)$  is an  $n$ -generated small left ideal of  $R$ . By (1),  $L$  is projective, so  $A \cong B \oplus L$  and then  $B$  is  $n$ -generated. Since  $B$  is isomorphic to a small submodule of  $R^{m-1}$ , the induction hypothesis gives  $B$ , hence  $A$ , is projective.

(2)  $\Rightarrow$  (1) and (2)  $\Leftrightarrow$  (3) are clear.

(2)  $\Leftrightarrow$  (4) By the Schanuel's Lemma [12, Theorem 3.62].  $\square$

**Corollary 5.3.** *If  $R$  is a left  $J$ -semihereditary ring, then every finitely generated small submodule of a free left  $R$ -module is projective.*

**Theorem 5.4.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is a left  $J$ - $n$ -semihereditary ring.
- (2)  $R$  is left strongly  $J$ - $n$ -coherent and every submodule of a strongly  $J$ - $n$ -flat right  $R$ -module is strongly  $J$ - $n$ -flat.
- (3)  $R$  is left strongly  $J$ - $n$ -coherent and every right ideal is strongly  $J$ - $n$ -flat.
- (4)  $R$  is left strongly  $J$ - $n$ -coherent and every finitely generated right ideal is strongly  $J$ - $n$ -flat.
- (5) Every quotient module of a strongly  $J$ - $n$ -injective left  $R$ -module is strongly  $J$ - $n$ -injective.
- (6) Every quotient module of an injective left  $R$ -module is strongly  $J$ - $n$ -injective.
- (7) Every left  $R$ -module has a monic strongly  $J$ - $n$ -injective cover.
- (8) Every right  $R$ -module has an epic strongly  $J$ - $n$ -flat envelope.
- (9) For every finitely generated small submodule of the right  $R$ -module  $R^n$ ,  $R^n/S$  has an epic finitely generated projective envelope.
- (10) Every torsionless right  $R$ -module is strongly  $J$ - $n$ -flat.

**Proof.** (2) $\Rightarrow$ (3) $\Rightarrow$ (4), and (5) $\Rightarrow$ (6) are trivial.

(1) $\Rightarrow$ (2) Assume (1). Then by Theorem 5.2(2),  $R$  is left strongly  $J$ - $n$ -coherent. Let  $A$  be a submodule of a strongly  $J$ - $n$ -flat right  $R$ -module  $B$  and  $L$  an  $n$ -generated small submodule of a finitely generated free left  $R$ -module  $F$ . Then  $L$  is projective and hence flat. Thus the exactness of the sequence  $0 = \text{Tor}_2(B/A, F) \rightarrow \text{Tor}_2(B/A, F/L) \rightarrow \text{Tor}_1(B/A, L) = 0$  implies that  $\text{Tor}_2(B/A, F/L) = 0$ . And so, from the exactness of the sequence  $0 = \text{Tor}_2(B/A, F/L) \rightarrow \text{Tor}_1(A, F/L) \rightarrow \text{Tor}_1(B, F/L) = 0$  we have that  $\text{Tor}_1(A, F/L) = 0$ , it shows that  $A$  is strongly  $n$ -flat.

(4) $\Rightarrow$ (1) Let  $L$  be an  $n$ -generated small submodule of a finitely generated free left  $R$ -module  $F$ . Then  $L$  is finitely presented as  $R$  is left strongly  $J$ - $n$ -coherent. Let  $I$  be any finitely generated right ideal of  $R$ . The exact sequence  $0 \rightarrow I \rightarrow R \rightarrow R/I \rightarrow 0$  implies the exact sequence  $0 \rightarrow \text{Tor}_2(R/I, F/L) \rightarrow \text{Tor}_1(I, F/L) = 0$  since  $I$  is strongly  $J$ - $n$ -flat. So  $\text{Tor}_2(R/I, F/L) = 0$ , and hence we obtain an exact sequence  $0 = \text{Tor}_2(R/I, F/L) \rightarrow \text{Tor}_1(R/I, L) \rightarrow 0$ . Thus,  $\text{Tor}_1(R/I, L) = 0$ , and so  $L$  is a finitely presented flat left  $R$ -module. Therefore,  $L$  is projective.

(1) $\Rightarrow$ (5) Let  $M$  be a strongly  $J$ - $n$ -injective left  $R$ -module and  $N$  be a submodule of  $M$ . Then for any  $n$ -generated small submodule  $L$  of a finitely generated free left  $R$ -module  $F$ , since  $L$  is projective, the exact sequence  $0 = \text{Ext}^1(L, N) \rightarrow \text{Ext}^2(F/L, N) \rightarrow \text{Ext}^2(F, N) = 0$  implies that  $\text{Ext}^2(F/L, N) = 0$ . Thus the exact sequence  $0 = \text{Ext}^1(F/L, M) \rightarrow \text{Ext}^1(F/L, M/N) \rightarrow \text{Ext}^2(F/L, N) = 0$  implies that  $\text{Ext}^1(F/L, M/N) = 0$ . Therefore,  $M/N$  is strongly  $J$ - $n$ -injective.

(6) $\Rightarrow$ (1) Let  $L$  be an  $n$ -generated small submodule of a finitely generated free left  $R$ -module  $F$ . Then for any left  $R$ -module  $M$ , by (6),  $E(M)/M$  is strongly  $J$ - $n$ -injective, and so  $\text{Ext}^1(F/L, E(M)/M) = 0$ . Thus, the exactness of the sequence  $0 = \text{Ext}^1(F/L, E(M)/M) \rightarrow \text{Ext}^2(F/L, M) \rightarrow \text{Ext}^2(F/L, E(M)) = 0$  implies that  $\text{Ext}^2(F/L, M) = 0$ . Hence, the exactness of the sequence  $0 = \text{Ext}^1(F, M) \rightarrow \text{Ext}^1(L, M) \rightarrow \text{Ext}^2(F/L, M) = 0$  implies that  $\text{Ext}^1(L, M) = 0$ , this shows that  $L$  is projective, as required.

(5) $\Rightarrow$ (7) Since  $R$  is left strongly  $J$ - $n$ -coherent by (2), for any left  $R$ -module  $M$ , there is a strongly  $J$ - $n$ -injective cover  $f : E \rightarrow M$  by Corollary 4.8. Note that  $\text{im}(f)$  is strongly  $J$ - $n$ -injective by (5), and  $f : E \rightarrow M$  is a strongly  $J$ - $n$ -injective precover, so for the inclusion map  $i : \text{im}(f) \rightarrow M$ , there is a homomorphism  $g : \text{im}(f) \rightarrow E$  such that  $i = fg$ . Hence  $f = f(gf)$ . Observing that  $f : E \rightarrow M$  is a strongly  $J$ - $n$ -injective cover and  $gf$  is an endomorphism of  $E$ ,  $gf$  is an automorphism of  $E$ , and thus  $f : E \rightarrow M$  is a monic strongly  $J$ - $n$ -injective cover.

(7) $\Rightarrow$ (5) Let  $M$  be a strongly  $J$ - $n$ -injective left  $R$ -module and  $N$  be a submodule of  $M$ . By (7),  $M/N$  has a monic strongly  $J$ - $n$ -injective cover  $f : E \rightarrow M/N$ . Let  $\pi : M \rightarrow M/N$  be the natural epimorphism. Then there exists a homomorphism  $g : M \rightarrow E$  such that  $\pi = fg$ . Thus  $f$  is an isomorphism, and therefore  $M/N \cong E$  is strongly  $J$ - $n$ -injective.

(2) $\Leftrightarrow$ (8) Since the class of strongly  $J$ - $n$ -flat right  $R$ -modules is closed under direct summands and isomorphisms, so by [4, Theorem 2], the class of strongly  $J$ - $n$ -flat right  $R$ -modules is closed under direct product and submodules if and only if every right  $R$ -module has an epic strongly  $J$ - $n$ -flat envelope.

(8) $\Rightarrow$ (9) Let  $M = R^n/S$ , where  $S$  is a finitely generated small submodule of  $R^n$ . Then by (8),  $M$  has an epic strongly  $J$ - $n$ -flat envelope  $f : M \rightarrow N$ . By Theorem 3.2(6),  $f$  factors through a finitely generated free right  $R$ -module  $F$ , that is, there exist  $g : M \rightarrow F$  and  $h : F \rightarrow N$  such that  $f = hg$ . Since  $F$  is strongly  $J$ - $n$ -flat, there exists  $\varphi : N \rightarrow F$  such that  $g = \varphi f$ . So  $f = (h\varphi)f$ , and hence  $h\varphi = 1$  since  $f$  is epic. Hence,  $N$  is isomorphic to a direct summand of  $F$ , and thus  $N$  is finitely generated projective. Therefore,  $f : M \rightarrow N$  is a finitely generated projective envelope of  $M$ .

(9) $\Rightarrow$ (2) Clearly  $R$  is left strongly  $J$ - $n$ -coherent by Theorem 4.5(13). Now suppose that  $A$  is a submodule of a strongly  $J$ - $n$ -flat right  $R$ -module  $B$  and  $\iota : A \rightarrow B$  is the inclusion. Let  $L$  be a finitely generated small submodule of  $R^n_R$ . Then for any homomorphism  $f : R^n/L \rightarrow A$ ,  $\iota f$  factors through a finitely generated free right  $R$ -module  $F$  by Theorem 3.2(6). So there exists homomorphism  $g : R^n/L \rightarrow F$  and  $h : F \rightarrow B$  such that  $\iota f = hg$ . By (9),  $R^n/L$  has an epic finitely generated projective envelope  $\alpha : R^n/L \rightarrow P$ . So there exists a homomorphism  $\beta : P \rightarrow F$  such that  $g = \beta\alpha$ . It is easy to see that  $\text{Ker}(\alpha) \subseteq \text{Ker}(f)$ . Now we define  $\gamma : P \rightarrow A$  by  $\gamma(x) = f(y)$ , where  $x = \alpha(y)$ , then  $\gamma$  is a right  $R$ -homomorphism and  $f = \gamma\alpha$ . Therefore,  $A$  is strongly  $J$ - $n$ -flat by Theorem 3.2(6).

(2) $\Rightarrow$ (10) Let  $M$  be a torsionless right  $R$ -module. Then there exists an exact sequence  $0 \rightarrow M \rightarrow \prod R_R$ . By (2),  $R$  is left strongly  $J$ - $n$ -coherent and every submodule of a strongly  $J$ - $n$ -flat right  $R$ -module is strongly  $J$ - $n$ -flat, so  $M$  is strongly  $J$ - $n$ -flat by Theorem 4.6(4).

(10) $\Rightarrow$ (3) Assume (10). Then  $\prod R_R$  is strongly  $J$ - $n$ -flat, and hence  $R$  is left strongly  $J$ - $n$ -coherent by Theorem 4.5(4). Moreover, every right ideal of  $R$  is torsionless and so is strongly  $J$ - $n$ -flat.  $\square$

**Corollary 5.5.** *The following statements are equivalent for a ring  $R$ :*

- (1)  $R$  is a left  $J$ -semihereditary ring.
- (2)  $R$  is left  $J$ -coherent and submodules of strongly  $J$ -flat right  $R$ -modules are strongly  $J$ -flat.
- (3)  $R$  is left  $J$ -coherent and every right ideal is strongly  $J$ -flat.
- (4)  $R$  is left strongly  $J$ -coherent and every finitely generated right ideal is strongly  $J$ -flat.
- (5) Every quotient module of a  $J$ -FP-injective left  $R$ -module is  $J$ -FP-injective.
- (6) Every quotient module of an injective left  $R$ -module is  $J$ -FP-injective.
- (7) Every left  $R$ -module has a monic  $J$ -FP-injective cover.
- (8) Every right  $R$ -module has an epic strongly  $J$ -flat envelope.
- (9) For every finitely generated small submodule  $S$  of a free right  $R$ -module  $F$ ,  $F/S$  has an epic finitely generated projective envelope.
- (10) Every torsionless right  $R$ -module is strongly  $J$ -flat.

**Corollary 5.6.** *Let  $R$  be a semiregular ring. Then it is left  $n$ -semihereditary if and only if it is left  $J$ - $n$ -semihereditary.*

**Proof.** We need only to prove the sufficiency. Suppose  $R$  is left  $J$ - $n$ -semihereditary, then by Theorem 5.4(6), every quotient module of an injective left  $R$ -module is

strongly  $J$ - $n$ -injective. Since  $R$  is semiregular, every strongly  $J$ - $n$ -injective left  $R$ -module is strongly  $n$ -injective by Proposition 2.7. So every quotient module of an injective left  $R$ -module is strongly  $n$ -injective and hence  $n$ -injective. Hence, by [17, Theorem 3(2)],  $R$  is left  $n$ -semihereditary.  $\square$
