Analyzing Of Articles On Blue Economy Studies In Tourism 

Turizmde Mavi Ekonomi Çalışmaları Üzerine Makalelerin Analizi

Emine Yılmaz / Res. Asst. Dr. Muğla Sıtkı Koçman University, Faculty of Tourism
emineyola@mu.edu.tr**Nur Çelik İlal / Assoc. Prof. Dr.** Muğla Sıtkı Koçman University, Faculty of Tourism
nurcelik@mu.edu.tr**Abstract**

The concept of a blue economy, as an approach closely related to tourism, has been studied very limitedly in the field of tourism despite its importance and existential mission. The existing literature has been discussed mainly conceptually. No study has been found that reveals the details of the studies directly related to the blue economy and tourism and evaluates these studies in general. In this context, this study aims to present a bibliometric overview of the studies on the concept of blue economy in tourism in the Web of Science database. In the study, 74 articles on blue economy in tourism published in the Web of Science (WOS) database between 2015 and 2024 constituted the research sample. As a result of the bibliometric analysis of relevant articles, it was determined that studies on the blue economy experienced a slight growth trend followed by a decline. Studies from the United Kingdom, Spain, and the USA were among the most prominent. The most frequently used research method was qualitative research, especially document analysis. Although this study is limited to the WOS database, it is obvious that the visibility and citationability of these studies could be much higher. Despite the critical role of coastal and marine tourism in global maritime trade, it has been noted that blue economy and tourism-oriented studies have not received the recognition they deserve. This is particularly remarkable considering that three-quarters of the Earth's surface is covered by water and the increasing importance of coastal and marine tourism.

Keywords: Blue Economy, Blue Growth, Sustainable Development, Tourism, Vosviewer, Web Of Science.

Özet

Turizmle yakından ilişkili olan bir yaklaşım olarak mavi ekonomi kavramı, önemine ve varoluş misyonuna rağmen, turizm alanında oldukça sınırlı çalışılan bir konudur ve varolan literatür daha çok kavramsal düzeyde ele alınmıştır. Doğrudan mavi ekonomi ve turizm ile ilişkili yapılan çalışmaların detayını ortaya koyan ve bu çalışmaları genel olarak değerlendiren bir çalışmaya rastlanmamıştır. Bu bağlamda bu çalışmanın amacı, Web of Science veri tabanında bulunan mavi ekonomi kavramını turizmde ele alan çalışmaların bibliyometrik bir genel bakışını sunmaktır. Çalışmada, Web of Science (WOS) veritabanında 2015 ile 2024 yılları arasında yayınlanmış mavi ekonomi üzerine turizmde yapılan 74 makale araştırma örneklemini oluşturmuştur. İlgili makalelerin bibliyometrik analizi sonucunda, mavi ekonomi üzerine yapılan çalışmaların hafif bir büyüme trendi yaşadığı, ardından bir düşüşe geçtiği belirlenmiştir. Birleşik Krallık, İspanya ve ABD kaynaklı çalışmalar en öne çıkanlar arasında yer almıştır. En sık kullanılan araştırma yöntemi nitel araştırma, özellikle doküman analizi olmuştur. Bu çalışma Web of Science (WOS) veritabanı ile sınırlı olsa da bu çalışmaların görünürlüğü ve atıf alabilirliğinin çok daha yüksek olabileceği aşikardır. Kıyı ve deniz turizminin küresel deniz ticaretindeki önemli rolüne rağmen, mavi ekonomi ve turizm odaklı çalışmaların hak ettiği tanınırlığı alamadığı kaydedilmiştir. Bu durum, Dünya yüzeyinin dörtte üçünün suyla kaplı olduğu ve kıyı ve deniz turizminin artan önemi göz önünde bulundurulduğunda özellikle dikkat çekicidir.

Anahtar Kelimeler: Mavi Ekonomi, Mavi Büyüme, Sürdürülebilir Kalkınma, Turizm, Vosviewer, Web Of Science.

Introduction

Türkiye, The concept of the Blue Economy, which focuses on the use and protection of marine resources and supports sustainable development, has emerged as a paradigm in recent years, particularly in the maritime sector (Çalım, 2023). The concept of the Blue Economy was first included in the book "The Blue Economy: 10 Years, 100 Innovations, 100 Million Jobs" published by Gunter Pauli in 2010 and later used at the United Nations Conference on Sustainable Development in Rio de Janeiro in June 2012. Since then it has been actively used (Suluk, 2022). The blue economy, directly related to sustainable development goals, is also closely related to many sectors. Sectors such as fishing, tourism, and maritime transportation are especially closely associated with the blue economy (Yılmaz, 2020).

Sectors such as fisheries, coastal tourism, ports, renewable energy (wind, tides, waves, etc.), and marine logistics are considered part of the blue economy. Sustainable practices in these sectors contribute to economic development (Guerreiro, 2021). The blue economy aims to manage water resources efficiently to preserve them as valuable natural resources for current and future generations (OECD, 2016). According to the EU Blue Economy Report (2023), blue economy sectors created nearly 3,5 million jobs and contributed EUR 129.1 billion in gross value added (GVA) in 2020. (contributing 1.1% to the EU-27 economy), a 30%-decrease from €185.4 billion (1.5% of the EU-27 economy) in 2019. Employment decreased 26% from 4.50 million in 2019 to 3.34 million in 2020 (1.8% in terms of contribution to the EU27 economy). Coastal tourism is among the most impacted. Because Coastal tourism is at the forefront of BE's economic sectors (Kabil et al., 2021)

The concept of the blue economy is an important issue that should be addressed from the perspective of the tourism sector, taking into account the factors that constitute the supply sources of tourism. It has begun to find a place in studies over the last 10 years (see also: Birchenough, 2023; Garza-Gil, Varela-Lafuente & Perez-Perez, 2021; Henderson, 2019; Karani & Failler, 2020; Rogerson & Rogerson, 2019; Vázquez, García & Valenciano, 2021; Vrontisi et al., 2022). Although it is closely related to the tourism sector, the number of studies related to tourism has remained limited (see also: Cummings & Greenberg, 2022; Hall, 2021; Karani et al., 2020; Phelan, Ruhanen & Mair, 2020). Studies related to tourism are most often associated with coastal tourism (Karani et al., 2020; Tegal & Gurning, 2018;). However, the issue is closely related to the tourism sector. Fishing, for example, is one of the most important recreational activities for the tourism industry (Hall, 2021). Recreational fishing includes both ocean and coastal activities and inland fishing on lakes and rivers, which can be extremely important for tourism (Hall & Härkönen, 2006).

As a matter of fact, the blue economy, which concerns many tourism-related issues from coastal tourism to yacht tourism and fishing activities, is an issue that needs to be addressed in terms of creating income sources in tourism, sustainability of the tourism market and protecting the seas and biodiversity in the future. In this context, this study deals with the tourism sector, which is a part of the blue economy. Considering the economic added value and employment opportunities created by the blue economy, it is essential to determine new strategies on the subject. In this context, the study aims to determine the current state of the literature on the blue economy and tourism, thus creating a guide for future studies. Although there has been a similar study in which coastal tourism and the blue economy were discussed together before (Kabil et al., 2021), it is thought to be important and contribute to the literature in that there is no study in which the concepts of blue economy and tourism are discussed together, which deals with the subject from a broader perspective. Depending on the purpose of the study, the blue economy phenomenon in tourism was analyzed by bibliometric analysis. This study aims to reveal the current status of studies on blue economy and tourism, identify gaps in the literature, and offer suggestions for future studies. Therefore, this study will be useful in providing information for those working in this field as a starting point and contributing to the literature.

Conceptual Framework

The concept of a blue economy, which emerged to protect oceans, seas, and water resources, includes all kinds of economic activities carried out in waters, covering sectors such as fishing, tourism, or maritime transportation (Bax et al., 2022). Studies in the literature on blue growth, blue development, and blue economy are mainly discussed together with issues related to climate change, marine ecosystems, and sustainable use of marine resources. (Armstrong et al., 2019; Graziano et al., 2022). In their study, Armstrong et al. (2019) determine the effects of human activities and climate change on deep-sea ecosystems and define the risk levels of these effects on ecosystem services. To this end, it contributes to promoting the sustainable use of deep-sea resources within the framework of blue growth and marine space planning (MSP). In his study, Hassanali (2022) aimed to examine the legal and political documents and organizational regulations that direct the development and implementation of regional ocean management and blue economy policies within CARICOM (Caribbean Community).

According to the study, CARICOM needs to be more sensitive, holistic, and cross-sectional while making policies about ocean management and the blue economy. Existing literature studies focus on the definition of the blue economy and its definitions rela-

Analyzing Of Articles On Blue Economy Studies In Tourism

ted to maritime, oceans, and coasts. Studies on its relationship with tourism have mainly been evaluated on the coasts. Kamil et al. (2022), blue economy, and coastal tourism were discussed together, and bibliometric analysis and a quantitative meta-analysis were chosen as a literature review method to determine the research topics and publication patterns of studies in this field. As a result of the research, the number of publications in the blue economy scientific sector has increased significantly.

In contrast, despite the critical role of the coastal tourism sector in the blue economy, there are relatively few studies on coastal tourism in the blue economy literature. In the study conducted by Tegar and Gurning (2018), the effects of sea and coastal tourism and whether it is compatible with other human activities are discussed within the scope of the blue economy. The study reveals that the concepts of blue economy and ecotourism can reduce the environmental impacts of marine and coastal tourism and, at the same time, promote economic growth. Picken (2023) reveals that the concept of blue economy should be considered within the framework of the blue economy of marine tourism, coastal tourism, and freshwater tourism activities. In his study, he argues that tourism academics can contribute to developing the blue economy concept and ensure that tourism-related activities are handled more effectively in planning and policy development processes.

Methodology

The bibliometric method is a technique that is becoming widespread in the field of tourism and examines various features of printed publications through numerical analysis. This method provides important clues about the scientific communication process of the relevant field (Temizkan et al., 2015: 394). Thanks to bibliometric analysis, it becomes possible to classify these studies according to the direction in which the studies in the field of tourism are progressing, the topics discussed and their perspectives. These analyzes can provide researchers with predictions for future studies on how studies in the field of tourism can be improved (Oruç & Türkay, 2017). As men-

tioned in the previous parts of the study, the blue economy and tourism are inseparable fields. Despite this, it does not receive the value it deserves in the literature. To present this view concretely, this study was prepared with the bibliometric analysis method. In this context, this study aims to examine the articles published in journals scanned in the Web of Science database, specifically on the concepts of "blue economy" and "tourism", and make some findings and suggestions. In line with the purpose of the study, a screening was carried out on the following research:

- In which years and how often were the studies carried out?
- What is the distribution of the journals in which the studies are published?
- What is the author-country distribution of the studies?
- What are the main research methods used in the studies?
- What are the main keywords used in the studies?
- What is the distribution of citations to studies?

In this context, a literature review was conducted on the Web of Science database between 15.06.2024 and 15.07.2024. Before starting the research, some filters were used throughout the system. First of all, only articles were included in the research. In addition, due to the language barrier and accessibility concerns, open access and English language options were preferred. In line with the purpose of the research, the keywords "blue economy" and "tourism" were used in quotations to initiate the search process. After searching with the keywords "blue economy" and "tourism," the total of 148 studies that emerged was reduced to 74 articles due to our limitations, and the analysis process was conducted on these 74 articles. While presenting the analysis results, the clustering and visualization feature of the VOSviewer program was utilized.

Findings

The information resulting from the literature review is presented in tabulated form in Table 1 below.

Table 1. The results of the literature review

Reference	Year	Title	Journal	Country	Keywords	Method	Citation Number
Pinto, Cruz & Combe	2015	Cooperation and the emergence of maritime clusters in the Atlantic: Analysis and implications of innovation and human capital for blue growth	Marine Policy	Portugal, Spain, Ireland and Scotland	Absorptive capacity, Innovation, Human capital, LOGIT, Maritime cluster, Proximity, Social capital	Quantitative / surveys	48

Bond	2019	Blue Economy threats, contradictions and resistances seen from South Africa	Journal of Political Ecology	South Africa	Blue Economy, capitalist crisis, Oceans Phakisa, resistance, South Africa	Conceptualized	27

Luoma et al.	2024	Sustainability as a shared objective? Stakeholders' interpretations on the sustainable development of marinas in the Gulf of Finland	Ocean & Coastal Management	Finland	Leisure boating, Coastal tourism, Influence diagrams, Baltic Sea, Blue economy	Qualitative/ interview	0"

In Table 1 above, the following information related to the reviewed articles is summarized: year, author, journal name, country of origin of the article, keywords, method used, and the number of citations. The reason for this is to understand aspects such as the level of interest in the topic, who has shown interest and when, and how the subject has been addressed.

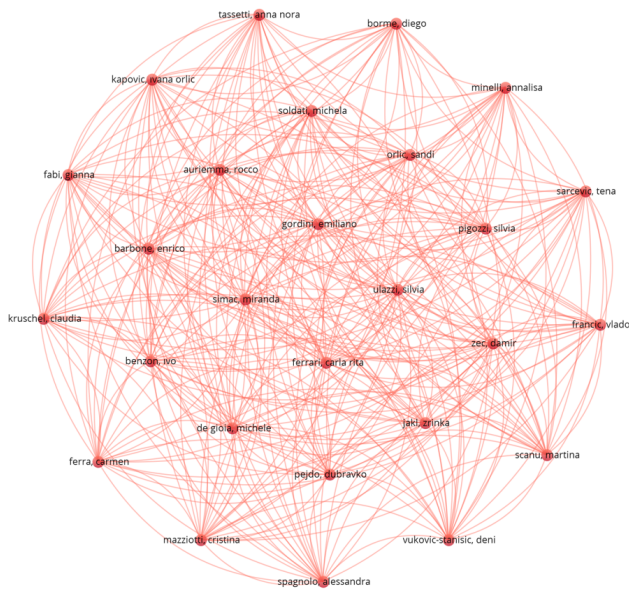

Figure 1. The VOSviewer scheme for the authors of the publications

When looking at authors conducting studies focused on the blue economy and tourism, it is observed that at least three authors predominantly prepare the studies. As shown in Figure 1 above, according to the visual created by the VOSviewer program, there is no specific clustering among the authors working on these topics. On the other hand, in individual searches, the most frequently encountered authors are Martínez-Vázquez, García, and Valenciano. The comment that can be made regarding this is that there are no researchers producing works frequently enough to be considered authorities on tourism and blue economy topics.

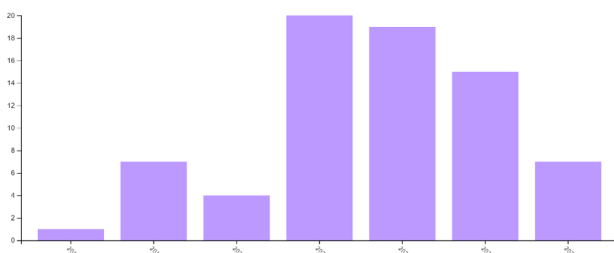

Figure 2. Yearly publication numbers
Source: Web of Science (2024)

When examining the studies on a yearly basis, the distribution of the studies' publication years is shown in Figure 2 above. In this context, it is observed that

the studies were published between 2015 and 2024, with only a single study on the topic conducted in 2015. The interest in the subject peaked in 2021 and 2022, but subsequently, there has been a declining trend.

Figure 3. The journals where articles were published

Another aspect examined was the journals in which these studies were published. In this context, the main journals where the publications, detailed in Table 1 above, are clustered by VOSviewer are shown in Figure 3. It is observed that most studies related to the topic have been published in the journals Marine Policy, Frontiers in Marine Science and Sustainability.

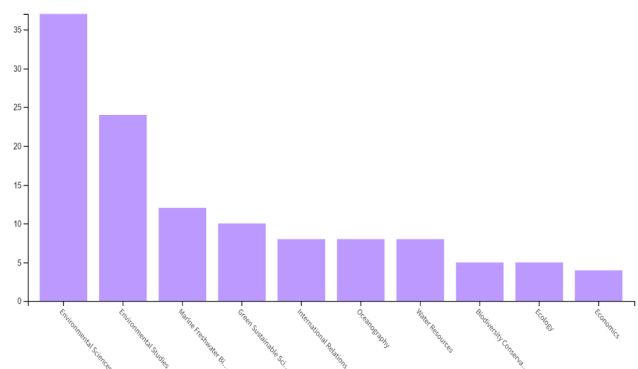

Figure 4. Research areas of the publications

According to Figure 4 above, the research areas of the publications are seen. More than 82 % of the articles are based on environmental sciences and studies (Web of Science, 2024). Interestingly, the economic-focused articles only account for 5% of the discussion on the blue economy. Therefore, it can be said that studies on the blue economy and tourism appear to focus more on environmental aspects than on economic ones.

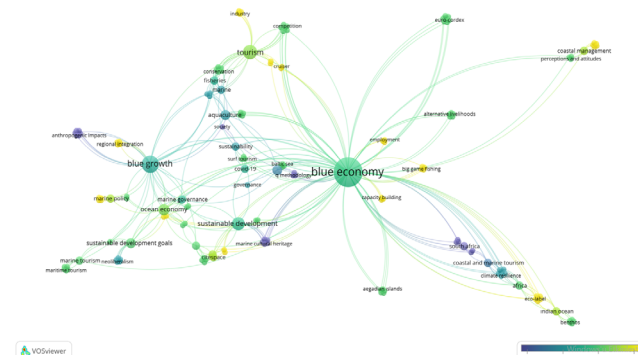

Figure 5. The keywords of the articles with a scheme of VOSviewer

Analyzing Of Articles On Blue Economy Studies In Tourism

On the other hand, even though the articles' research areas are mainly environmental, the most frequently used keywords are blue economy, blue growth, tourism, sustainable development, ocean economy, and sustainable development goals according to the scheme of VOSviewer in Figure 5.

Figure 6. Countries of the articles scheme of VOSviewer

Data on the countries where the studies were conducted have been examined and illustrated in Figure 6 above. It is known that all the countries where the studies were conducted have coastlines along seas or oceans and derive economic income from marine environments. However, in terms of clustering, most studies have been conducted in England, Spain, and the USA, with these three countries accounting for more than half of the studies conducted.

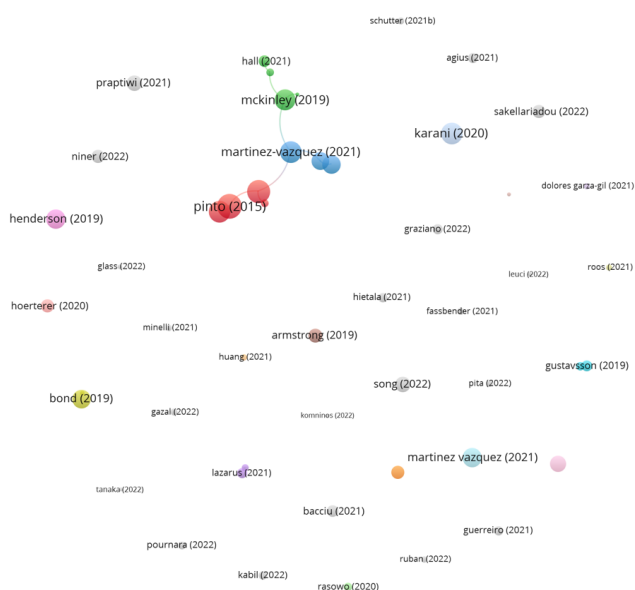

Figure 7. The most cited articles scheme of VOSviewer

In Figure 7 above, the citations made to published works are shown clustered by author. More detailed numbers are also provided in Table 1 above. According to these data, 10 of the listed works have not yet received any citations. Among the works that have received the most citations are those by Pinto et al., van den Burg et al., and Martinez-Vazquez et al. Overall, the topic has a relatively low citation rate. Finally, the methods used in the studies were examined. In this regard, 46 of the studies were conducted using qualitative research methods and document analysis. Additionally, 12 studies were prepared using quantitative methods, primarily through survey techniques. Ten studies were entirely concep-

tual, and six employed a mixed-methods approach. This indicates that the topic has predominantly been studied using qualitative methods, relying on relevant documents and literature.

Conclusion

The concept of a blue economy has recently become one of the prominent topics as it is closely related to the tourism sector (Kabil et al., 2021). This study aims to contribute to the relevant literature by examining the research on blue economy and tourism within the framework of the determined criteria (year of the study, distribution of the journals in which it was published, author-country distribution, basic research methods, keywords used, and citation).

The results of this research provide important findings in terms of revealing the place of the blue economy concept in tourism and the diversity of studies conducted in this field. 74 articles published in the Web of Science database between 2015 and 2024 were examined and analyzed. In this context, the most striking finding about the study is that despite the importance of coastal and marine tourism in general maritime trade and international tourism mobility, it deserves a different and better position. Blue economy studies in tourism, which have only a 10-year writing history, have already entered a downward trend. Unlike what Martinez-Vazquez et al. (2021b) found in their research, now it is a certain finding that blue economy studies related to tourism are visibly decreasing. However, the issue is also critical in terms of sustainable tourism. Although blue economy scientific production has increased significantly over the years (Kabil et al., 2021), the subject of blue economy and tourism has received relatively less attention in the literature despite the critical role of coastal tourism in the blue economy. The findings reflect changes in research priorities and emerging themes within the academic community, underlining the dynamic nature of academic interest in the blue economy in tourism.

According to the results, England, Spain, and the USA are among the countries that stand out in studies on blue economy and tourism. These countries are considered leaders in this field of research, having produced literature addressing various aspects of the blue economy. Kabil et al. (2021) state that when scientific production related to the blue economy is examined, China, England, Kenya, and the USA emerge as the most productive countries. This shows that research efforts are spread across different continents, underscoring global interest in the blue economy. These findings show that although the blue economy is a globally valid concept, the academic focus on this topic varies across regions.

Many of these studies use qualitative research methods, especially document analysis. This methodo-

logical approach has facilitated an in-depth investigation of the dimensions of the blue economy. In particular, the article titled "Collaboration and the Emergence of Maritime Clusters in the Atlantic: Analysis and Implications of Innovation and Human Capital for Blue Growth" garnered the most citations. This study highlights the critical role of maritime clusters in the Atlantic region, examining their contribution to innovation and human capital development and emphasizing the importance of blue growth. Document analysis is essential because it provides a basis for new studies by reviewing the existing literature and previous research (Yıldırım & Şimşek, 2016). On the other hand, the lack of current publications and information may not reflect the current situation. In this respect, quantitative methods can also be used to obtain more generalizable data. Various methodological approaches and geographical representations in the literature enrich our understanding of the multifaceted nature of the blue economy and its implications for sustainable development in the tourism sector.

According to the results of keyword analysis, the terms after "blue economy," "blue growth," and "tourism", "sustainable development, ocean economy, and sustainable development goals" are the most frequent keywords in the literature. This reveals that the blue economy is an important concept in terms of economic development but also in terms of sustainability and environmental protection. The study by Hassanali (2022) also emphasizes the importance of the blue economy in sustainable development, especially in marine areas. The frequent occurrence of these terms in the literature emphasizes the subject's importance and currentness. The fact that the keywords blue economy, blue growth, and tourism come together emphasizes that the issue should be evaluated in terms of its sustainable, economic, and social dimensions. As an essential component of the blue economy, tourism can stimulate economic growth in marine and coastal regions. Tourism, especially based on marine ecosystems, can contribute to local economies. However, the adverse environmental effects of tourism also need to be considered. When discussing coastal tourism, if the blue economy and blue growth issues are discussed together and strategies are developed for this, it will positively affect the sector in practice.

However, the visibility and citation rates of studies focusing on the blue economy and tourism are not as high as they could be. This implies that the number of publications and citations is relatively low compared to the significance of the topic. Just by looking at the number of citations, one can once again witness how low the number of publications on the subject is. Not working on the subject may indicate two issues: first, everyone already knows the subject well and does not need to study. Secondly, the importance of the subject has not been adequately

understood, and the subject has not become a focal point to be studied; in other words, there has not been enough curiosity for research. However, as stated in the conceptual framework, the blue economy is a multidimensional field that concerns the whole world and deserves to be given more importance. Thus, increasing awareness and scholarly engagement with this subject could enhance its academic prominence and highlight its importance in promoting sustainable practices within maritime sectors. This underscores the need for more focused research and greater dissemination of findings to elevate the blue economy's profile within the academic community.

These results reveal that blue economy studies need the attention they deserve, considering that two-thirds of the earth's surface is covered with water and the increasing importance of coastal and marine tourism in the global economy. It is emphasized that future research should examine the different dimensions of the blue economy in more depth and better understand this field's economic, environmental, and social aspects. In this context, promoting sustainable practices and raising awareness about the blue economy should be an essential agenda item both in the academic world and among policymakers. It should not be forgotten that the blue economy is of critical importance in terms of economic development, sustainability, and environmental protection. Therefore, researchers and policymakers must adopt versatile and innovative approaches to unlock the full potential of the blue economy. This situation also shows that the number and citation rates of studies on the blue economy and tourism should be increased. More coverage in academic literature and increased awareness of this issue will contribute to a better understanding of the importance of the blue economy in global maritime trade. This could offer new opportunities for both researchers and policymakers and further strengthen the blue economy's contribution to sustainable development.
