### Abstract

In this study, several novel integral inequalities are established for various classes of convex functions by employing the Caputo–Fabrizio fractional integral operator. Specifically, new inequalities are derived for  $m$ -convex and  $(\alpha, m)$ -convex functions. The presented results generalize and extend existing inequalities in the literature, reducing to known outcomes for certain specific parameter values. The derivations rely on the fundamental properties of the Caputo–Fabrizio fractional operator, formal definitions of different types of convexity, and standard analytical techniques.

**Keywords:** Caputo-Fabrizio fractional integral operator,  $m$ -convex functions,  $(\alpha, m)$ -convex functions.

### 1. Introduction

The theory of inequalities plays a fundamental role in mathematical analysis and has become a focal point of modern research due to its extensive applications in various fields such as statistics, approximation theory, optimization, and numerical analysis. Within this broad domain, convex functions occupy a central position, not only because of their intrinsic connection to inequalities through their definitions, but also due to their elegant mathematical structure and the wide range of generalizations they admit.

Convexity, in its classical form, has inspired the development of numerous generalized convexity concepts, such as  $m$ -convexity and  $(\alpha, m)$ -convexity, each tailored to capture specific functional behaviors and to extend the applicability of known inequalities. These generalized convex functions have proven useful in obtaining more refined and flexible forms of integral inequalities.

On the other hand, the theory of fractional calculus—particularly involving non-singular and non-local operators—has attracted increasing attention in recent years. Among these operators, the Caputo–Fabrizio fractional operator, characterized by its exponential kernel and absence of singularity, has emerged as a powerful tool in modeling memory-dependent processes and in deriving new analytical results.

Motivated by the growing interest in both generalized convex functions and fractional operators, this paper aims to establish several new integral inequalities for  $m$ -convex and  $(\alpha, m)$ -convex functions via the Caputo–Fabrizio fractional integral operator. The results presented herein not only extend known inequalities but also unify various existing findings as special cases under particular parameter choices. The derivations are based on the properties of the Caputo–Fabrizio operator, the defining characteristics of generalized convex functions, and classical tools of analysis.

We begin by recalling essential definitions and preliminary results that will be used throughout the paper.

## 2. Materials and Methods

In this section, we present some essential definitions and foundational concepts that will be used in the subsequent analysis.

**Definition 2.1.** Let  $I$  be on interval in  $R$ . Then  $f: I \rightarrow R$  is said to be convex, if

$$f(tx + (1-t)y) \leq tf(x) + (1-t)f(y)$$

holds for all  $x, y \in I$  and  $t \in [0,1]$  (Pecaric et al. 1992).

**Definition 2.2.** (Toader 1984) The function  $f: [0, b] \rightarrow R$ ,  $b > 0$ , is said to be  $m$ -convex, where  $m \in [0,1]$ , if we have

$$f(tx + m(1-t)y) \leq tf(x) + m(1-t)f(y)$$

for all  $x, y \in [0, b]$  and  $t \in [0,1]$ .

**Definition 2.3.** (Miheşan 1993) The function  $f: [0, b] \rightarrow R$ ,  $b > 0$  is said to be  $(\alpha, m)$ -convex, where  $(\alpha, m) \in [0,1]^2$ , if we have

$$f(tx + m(1-t)y) \leq t^\alpha f(x) + m(1-t^\alpha)f(y)$$

for all  $x, y \in [0, b]$  and  $t \in [0,1]$ .

This class generalizes both convex and  $m$ -convex functions and has been widely studied due to its applications in integral inequalities (Miheşan 1993, Özdemir et al 2011).

These generalized convex functions provide greater flexibility than classical convex functions in the derivation of functional inequalities, especially when used in conjunction with fractional integral operators.

**Definition 2.4.** Let  $f \in H^1(0, b)$ ,  $b > a$ ,  $\alpha \in [0,1]$  then, the definition of the left and right Caputo-Fabrizio fractional integral is:

$$({}^{CF}I_a^\alpha)(t) = \frac{1-\alpha}{B(\alpha)}f(t) + \frac{\alpha}{B(\alpha)}\int_a^t f(y)dy,$$

and

$$({}^{CF}I_b^\alpha)(t) = \frac{1-\alpha}{B(\alpha)}f(t) + \frac{\alpha}{B(\alpha)}\int_t^b f(y)dy$$

where  $B(\alpha) > 0$  is normalization function (Abdeljawad and Baleanu 2017).

Throughout the remainder of the paper, we shall refer to the normalization function by  $B(\alpha)$ , where it satisfies  $B(0) = B(1) = 1$ .

Tariq et al. (2022) established a Hermite-Hadamard type integral inequality for preinvex functions by employing the Caputo-Fabrizio fractional integral, as given below.

**Theorem 2.1.** Let  $f: I = [k_1, k_1 + \mu(k_2, k_1)] \rightarrow (0, \infty)$  be a preinvex function on  $I^\circ$  and  $f \in L[k_1, k_1 + \mu(k_2, k_1)]$ . If  $\alpha \in [0,1]$ , then the following inequality holds

$$\begin{aligned} & f\left(\frac{2k_1 + \mu(k_2, k_1)}{2}\right) \\ & \leq \frac{B(\alpha)}{\alpha\mu(k_2, k_1)} \\ & \times \left[ {}^{CF}I_{k_1}^\alpha \{f(k)\} + {}^{CF}I_{k_1 + \mu(k_2, k_1)}^\alpha \{f(k)\} \right. \\ & \quad \left. - \frac{2(1-\alpha)}{B(\alpha)} f(k) \right] \\ & \leq \frac{f(k_1) + f(k_2)}{2} \end{aligned}$$

where  $k \in [k_1, k_1 + \mu(k_2, k_1)]$ .

By utilizing the Mittag-Leffler function within the framework of the Caputo-Fabrizio derivative, Atangana and Baleanu formulated new fractional derivative operators, presented as follows

**Definition 2.5.** (Atangana and Baleanu 2017). Let  $f \in H^1(0, b)$ ,  $b > a$ ,  $\alpha \in [0,1]$  then, the definition of the new fractional derivative is given:

$$(1.1) \quad ({}^{ABC}D_t^\alpha)[f(t)] = \frac{B(\alpha)}{1-\alpha} \int_a^t f'(x) E_\alpha \left[ -\alpha \frac{(t-x)^\alpha}{(1-\alpha)} \right] dx.$$

**Definition 2.6.** (Atangana and Baleanu 2017). Let  $f \in H^1(0, b)$ ,  $b > a$ ,  $\alpha \in [0,1]$  then, the definition of the new fractional derivative is given:

$$(1.2) \quad ({}^{ABR}D_t^\alpha)[f(t)] = \frac{B(\alpha)}{1-\alpha} \frac{d}{dt} \int_a^t f(x) E_\alpha \left[ -\alpha \frac{(t-x)^\alpha}{(1-\alpha)} \right] dx.$$

Both Equations (1.1) and (1.2) feature non-local kernels. Additionally, Equation (1.1) yields zero when the input function is constant.

The associated fractional integral operator was defined by Atangana and Baleanu as follows.

**Definition 2.7.** The fractional integral associate to the new fractional derivative with non-local kernel of a function  $f \in H^1(a, b)$  as defined:

$${}^{AB}I_a^\alpha \{f(t)\} = \frac{1-\alpha}{B(\alpha)} f(t) + \frac{\alpha}{B(\alpha)\Gamma(\alpha)} \int_a^t f(y)(t-y)^{\alpha-1} dy$$

where,  $b > a$ ,  $\alpha \in [0,1]$  (Atangana and Baleanu 2017).

Abdeljawad and Baleanu introduced right hand side of integral operator as follows; The right fractional new integral with ML kernel of order  $\alpha \in [0,1]$  is defined by

$${}^{AB}I_b^\alpha \{f(t)\} = \frac{1-\alpha}{B(\alpha)} f(t) + \frac{\alpha}{B(\alpha)\Gamma(\alpha)} \int_t^b f(y)(y-t)^{\alpha-1} dy.$$

where,  $b > a$ ,  $\alpha \in [0,1]$  (Abdeljawad and Baleanu 2017).

To explore the diverse formulations and applications of fractional operators, we direct interested readers to the following references, which offer detailed discussions and significant contributions to the field (Abdeljawad 2015, Abdeljawad and Baleanu 2017, Akdemir et al. 2021, Akdemir et al. 2022-Akdemir et al. 2017, Butt et al. 2020, Caputo and Fabrizio 2015, Gürbüz et al. 2020, Rashid et al 2020, Samko et al. 1993, Set 2012, Set et al. 2017).

### 3. Results

**Theorem 3.1.** Let  $I \subseteq \mathbb{R}$ . Suppose that  $f: [a, b] \subseteq I \rightarrow \mathbb{R}$  is a m-convex function on  $[a, b]$  such that  $f \in L_1[a, b]$ . Then, we have the following inequality for Caputo-Fabrizio fractional integrals:

$$({}^{CF}I_a^\alpha f)(k) + ({}^{CF}I_b^\alpha f)(k) \leq \frac{4(1-\alpha)f(k) + \alpha(b-a)(f(a) + mf(b))}{2B(\alpha)}$$

where  $B(\alpha) > 0$  is normalization function  $m \in (0,1]$  and  $\alpha \in [0,1]$ .

**Proof.** By using the definition of convex function, we can write

$$f(ta + m(1-t)b) \leq tf(a) + m(1-t)f(b).$$

By integrating both sides of the inequality over  $[0,1]$  with respect to  $t$ , we get

$$\int_0^1 f(ta + m(1-t)b) dt$$

$$\leq \int_0^1 tf(a) dt + \int_0^1 m(1-t)f(b) dt.$$

By changing the variable as  $x = ta + (1-t)b$  and by calculating the right hand side, we obtain

$$\frac{1}{b-a} \int_a^b f(x) dx \leq \frac{f(a) + mf(b)}{2}.$$

By multiplying both sides of the above inequality with  $\frac{\alpha(b-a)}{B(\alpha)}$  and adding  $\frac{2(1-\alpha)}{B(\alpha)} f(k)$ , we have

$$\frac{2(1-\alpha)}{B(\alpha)} f(k) + \frac{\alpha}{B(\alpha)} \int_a^b f(x) dx \leq \frac{2(1-\alpha)}{B(\alpha)} f(k) + \frac{\alpha(b-a)}{B(\alpha)} \frac{|f(a)| + m|f(b)|}{2}.$$

By simplifying the inequality, we get the result as:

$$\left( \frac{1-\alpha}{B(\alpha)} f(k) + \frac{\alpha}{B(\alpha)} \int_a^k f(x) dx \right) + \left( \frac{1-\alpha}{B(\alpha)} f(k) + \frac{\alpha}{B(\alpha)} \int_k^b f(x) dx \right) \leq \frac{2(1-\alpha)}{B(\alpha)} f(k) + \frac{\alpha(b-a)}{B(\alpha)} \frac{f(a) + mf(b)}{2}.$$

Therefore, we can write

$$({}^{CF}I_a^\alpha f)(k) + ({}^{CF}I_b^\alpha f)(k) \leq \frac{4(1-\alpha)f(k) + \alpha(b-a)(f(a) + mf(b))}{2B(\alpha)}.$$

This completes the proof.

**Theorem 3.2** Let  $I \subseteq \mathbb{R}$ . Suppose that  $f: [a, b] \subseteq I \rightarrow \mathbb{R}$  is a m-convex function on  $[a, b]$  such that  $f \in L_1[a, b]$ . Then, we have the following inequality for Caputo-Fabrizio fractional integrals:

$$({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \leq \frac{2(1-\alpha)|f(k)|(p+1)^{\frac{1}{p}} + \alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)(p+1)^{\frac{1}{p}}}$$

where  $B(\alpha) > 0$  is normalization function  $q > 1$ ,  $\frac{1}{q} + \frac{1}{p} = 1$ ,  $m \in (0,1]$  and  $\alpha \in [0,1]$ .

**Proof.** By using the definition of convex function, we can write

$$f(ta + (1-t)b) \leq tf(a) + m(1-t)f(b).$$

By taking the absolute values of both sides of the inequality, the integration is performed with respect to  $t$  in the interval  $[0,1]$ .

$$\int_0^1 |f(ta + (1-t)b)| dt \\ \leq |f(a)| \int_0^1 t dt + m|f(b)| \int_0^1 1-t dt.$$

If we apply the Hölder's inequality to the right-hand side of the inequality, we get

$$\int_0^1 |f(ta + (1-t)b)| dt \\ \leq |f(a)| \left( \int_0^1 t^p dt \right)^{\frac{1}{p}} \left( \int_0^1 1 dt \right)^{\frac{1}{q}} \\ + m|f(b)| \left( \int_0^1 (1-t)^p dt \right)^{\frac{1}{p}} \left( \int_0^1 1 dt \right)^{\frac{1}{q}}.$$

By changing the variable as  $x = ta + (1-t)b$  and by calculating the right hand side, we obtain

$$\frac{1}{b-a} \int_a^b |f(x)| dx \\ \leq |f(a)| \left( \frac{1}{p+1} \right)^{\frac{1}{p}} + m|f(b)| \left( \frac{1}{p+1} \right)^{\frac{1}{p}}.$$

By multiplying both sides of the above inequality with  $\frac{\alpha(b-a)}{B(\alpha)}$  and adding  $\frac{2(1-\alpha)}{B(\alpha)}|f(k)|$ , we have

$$\frac{2(1-\alpha)}{B(\alpha)}|f(k)| + \frac{\alpha}{B(\alpha)} \int_a^b |f(x)| dx \\ \leq \frac{2(1-\alpha)}{B(\alpha)}|f(k)| \\ + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)} \left( \frac{1}{p+1} \right)^{\frac{1}{p}}.$$

By simplifying the inequality, we get the result.

$$\left( \frac{1-\alpha}{B(\alpha)}|f(k)| + \frac{\alpha}{B(\alpha)} \int_a^k |f(x)| dx \right) \\ + \left( \frac{1-\alpha}{B(\alpha)}|f(k)| + \frac{\alpha}{B(\alpha)} \int_k^b |f(x)| dx \right) \\ \leq \frac{2(1-\alpha)}{B(\alpha)}|f(k)| \\ + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)} \left( \frac{1}{p+1} \right)^{\frac{1}{p}}.$$

The desired result is obtained as:

$$({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ \leq \frac{2(1-\alpha)|f(k)|(p+1)^{\frac{1}{p}} + \\ B(\alpha)(p+1)^{\frac{1}{p}} \\ + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)(p+1)^{\frac{1}{p}}}.$$

This completes the proof.

**Theorem 3.3.** Let  $I \subseteq \mathbb{R}$ . Suppose that  $f: [a, b] \subseteq I \rightarrow \mathbb{R}$  is a  $m$ -convex function on  $[a, b]$  such that  $f \in L_1[a, b]$ . Then, we have the following inequality for Caputo-Fabrizio fractional integrals:

$$({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ \leq \frac{2(1-\alpha)}{B(\alpha)}|f(k)| \\ + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)} \left( \frac{q+p(p+1)}{qp(p+1)} \right)$$

where  $B(\alpha) > 0$  is normalization function  $q > 1$ ,  $\frac{1}{p} + \frac{1}{q} = 1$ ,  $m \in (0,1]$  and  $\alpha \in [0,1]$ .

**Proof :** By using the definition of convex function, we can write

$$f(ta + (1-t)b) \leq tf(a) + m(1-t)f(b).$$

By taking the absolute values of both sides of the inequality, the integration is performed with respect to  $t$  in the interval  $[0,1]$ , then we get

$$\int_0^1 |f(ta + (1-t)b)| dt \\ \leq |f(a)| \int_0^1 t dt + m|f(b)| \int_0^1 (1-t) dt.$$

If we apply the Young's inequality to the right-hand side of the inequality, we get

$$\int_0^1 |f(ta + (1-t)b)| dt \\ \leq |f(a)| \left( \frac{1}{p} \left( \int_0^1 t^p dt \right) + \frac{1}{q} \left( \int_0^1 1^q dt \right) \right) \\ + m|f(b)| \left( \frac{1}{p} \left( \int_0^1 (1-t)^p dt \right) + \frac{1}{q} \left( \int_0^1 1^q dt \right) \right).$$

By changing the variable as  $x = ta + (1 - t)b$  and by calculating the right hand side, we obtain

$$\frac{1}{b-a} \int_a^b |f(x)| dx \leq |f(a)| \left( \frac{1}{p(p+1)} + \frac{1}{q} \right) + m|f(b)| \left( \frac{1}{p(p+1)} + \frac{1}{q} \right).$$

By multiplying both sides of the above inequality with  $\frac{\alpha(b-a)}{B(\alpha)}$  and adding  $\frac{2(1-\alpha)}{B(\alpha)} |f(k)|$ , we have

$$\begin{aligned} & \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_a^b |f(x)| dx \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| \\ & + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)} \left( \frac{1}{p(p+1)} + \frac{1}{q} \right). \end{aligned}$$

By simplifying the inequality, we get the result as:

$$\begin{aligned} & \left( \frac{1-\alpha}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_a^k |f(x)| dx \right) \\ & + \left( \frac{1-\alpha}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_k^b |f(x)| dx \right) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| \\ & + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)} \left( \frac{q+p(p+1)}{qp(p+1)} \right). \end{aligned}$$

After necessary operations, the result will be written as follows:

$$\begin{aligned} & ({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| \\ & + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)} \left( \frac{q+p(p+1)}{qp(p+1)} \right). \end{aligned}$$

**Theorem 3.4.** Let  $I \subseteq \mathbb{R}$ . Suppose that  $f: [a, b] \subseteq I \rightarrow \mathbb{R}$  is a  $(\alpha_1, m)$ -convex function on  $[a, b]$  such that  $f \in L_1[a, b]$ . Then, we have the following inequality for Caputo-Fabrizio fractional integrals:

$$\begin{aligned} & ({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ & \leq \frac{2(1-\alpha)|f(k)|(\alpha_1 + 1)}{B(\alpha)(\alpha_1 + 1)} \\ & + \frac{\alpha(b-a)(|f(a)| + m|f(b)|)}{B(\alpha)(\alpha_1 + 1)} \end{aligned}$$

where  $B(\alpha) > 0$  is normalization function  $m \in (0, 1]$  and  $\alpha, \alpha_1 \in [0, 1]$ .

**Proof :** By using the definition of  $(\alpha_1, m)$ -convex function, we can write

$$f(ta + (1-t)b) \leq t^{\alpha_1} f(a) + m(1-t^{\alpha_1}) f(b).$$

By taking the absolute values of both sides of the inequality, the integration is performed with respect to  $t$  in the interval  $[0, 1]$ , then one has

$$\begin{aligned} & \int_0^1 |f(ta + (1-t)b)| dt \\ & \leq \int_0^1 t^{\alpha_1} |f(a)| dt + \int_0^1 (1-t^{\alpha_1}) m |f(b)| dt. \end{aligned}$$

By changing the variable as  $x = ta + (1-t)b$  and by calculating the right hand side, we obtain

$$\frac{1}{b-a} \int_a^b |f(x)| dx = \frac{|f(a)| + \alpha_1 m |f(b)|}{\alpha_1 + 1}.$$

By multiplying both sides of the above inequality with  $\frac{\alpha(b-a)}{B(\alpha)}$  and adding  $\frac{2(1-\alpha)}{B(\alpha)} |f(k)|$ , we have

$$\begin{aligned} & \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_a^b |f(x)| dx \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha(b-a)}{B(\alpha)} \frac{|f(a)| + \alpha_1 m |f(b)|}{\alpha_1 + 1}. \end{aligned}$$

By simplifying the inequality, we get the following result

$$\begin{aligned} & \left( \frac{1-\alpha}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_a^k |f(x)| dx \right) \\ & + \left( \frac{1-\alpha}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_k^b |f(x)| dx \right) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha(b-a)}{B(\alpha)} \frac{|f(a)| + \alpha_1 m |f(b)|}{\alpha_1 + 1}. \end{aligned}$$

After necessary operations, the result will be given as follows:

$$\begin{aligned} & ({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ & \leq \frac{2(1-\alpha)|f(k)|(\alpha_1 + 1)}{B(\alpha)(\alpha_1 + 1)} \\ & + \frac{\alpha(b-a)(|f(a)| + \alpha_1 m |f(b)|)}{B(\alpha)(\alpha_1 + 1)} \end{aligned}$$

**Theorem 3.5.** Let  $I \subseteq \mathbb{R}$ . Suppose that  $f: [a, b] \subseteq I \rightarrow \mathbb{R}$  is a  $(\alpha_1, m)$ -convex function on  $[a, b]$  such that  $f \in L_1[a, b]$ . Then, we have the following inequality for Caputo-Fabrizio fractional integrals:

$$\begin{aligned} & ({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| \\ & + \frac{\alpha(b-a)}{B(\alpha)} \left( \frac{|f(a)| + \alpha_1 m |f(b)| (p\alpha_1)^{\frac{1}{p}}}{(p\alpha_1 + 1)^{\frac{1}{p}}} \right). \end{aligned}$$

where  $B(\alpha) > 0$  is normalization function  $q > 1$ ,  $\frac{1}{p} + \frac{1}{q} = 1$ ,  $m \in (0, 1]$  and  $\alpha, \alpha_1 \in [0, 1]$ .

**Proof :** By using the definition of  $(\alpha_1, m)$ -convex function, we can write

$$f(ta + (1-t)b) \leq t^{\alpha_1} f(a) + m(1-t^{\alpha_1}) f(b).$$

By taking the absolute values of both sides of the inequality, the integration is performed with respect to  $t$  in the interval  $[0, 1]$ , then we have

$$\begin{aligned} & \int_0^1 |f(ta + (1-t)b)| dt \\ & \leq \int_0^1 t^{\alpha_1} |f(a)| dt + \int_0^1 (1-t^{\alpha_1}) m |f(b)| dt. \end{aligned}$$

If we apply the Hölder's inequality to the right-hand side of the inequality, we get

$$\begin{aligned} & \int_0^1 |f(ta + (1-t)b)| dt \\ & \leq |f(a)| \left( \int_0^1 |t^{\alpha_1}|^p dt \right)^{\frac{1}{p}} \left( \int_0^1 1^q dt \right)^{\frac{1}{q}} \\ & + m |f(b)| \left( \int_0^1 |1-t^{\alpha_1}|^p dt \right)^{\frac{1}{p}} \left( \int_0^1 1^q dt \right)^{\frac{1}{q}}. \end{aligned}$$

By using the fact that  $|1-t^{\alpha_1}|^p \leq 1-t^{p\alpha_1}$  for  $\alpha_1 > 0$ ,  $p > 1$ , we can write

$$\begin{aligned} & \int_0^1 |f(ta + (1-t)b)| dt \\ & \leq |f(a)| \left( \int_0^1 |t^{\alpha_1}|^p dt \right)^{\frac{1}{p}} \left( \int_0^1 1^q dt \right)^{\frac{1}{q}} \\ & + m |f(b)| \left( \int_0^1 |1-t^{p\alpha_1}| dt \right)^{\frac{1}{p}} \left( \int_0^1 1^q dt \right)^{\frac{1}{q}}. \end{aligned}$$

By changing the variable as  $x = ta + (1-t)b$  and by calculating the right hand side, we obtain

$$\begin{aligned} & \frac{1}{b-a} \int_a^b |f(x)| dx \\ & \leq |f(a)| \left( \frac{1}{p\alpha_1 + 1} \right)^{\frac{1}{p}} + m |f(b)| \left( \frac{p\alpha_1}{p\alpha_1 + 1} \right)^{\frac{1}{p}}. \end{aligned}$$

By multiplying both sides of the above inequality with  $\frac{\alpha(b-a)}{B(\alpha)}$  and adding  $\frac{2(1-\alpha)}{B(\alpha)} |f(k)|$ , we have

$$\begin{aligned} & \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_a^b |f(x)| dx \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha(b-a)}{B(\alpha)} \\ & \times \left( |f(a)| \left( \frac{1}{p\alpha_1 + 1} \right)^{\frac{1}{p}} + m |f(b)| \left( \frac{p\alpha_1}{p\alpha_1 + 1} \right)^{\frac{1}{p}} \right). \end{aligned}$$

By simplifying the inequality, we get

$$\begin{aligned} & \left( \frac{1-\alpha}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_a^k |f(x)| dx \right) \\ & + \left( \frac{1-\alpha}{B(\alpha)} |f(k)| + \frac{\alpha}{B(\alpha)} \int_k^b |f(x)| dx \right) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| \\ & + \frac{\alpha(b-a)}{B(\alpha)} \left( \frac{|f(a)| + m |f(b)| (p\alpha_1)^{\frac{1}{p}}}{(p\alpha_1 + 1)^{\frac{1}{p}}} \right). \end{aligned}$$

After necessary operations, we provide

$$\begin{aligned} & ({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| \\ & + \frac{\alpha(b-a)}{B(\alpha)} \left( \frac{|f(a)| + m |f(b)| (p\alpha_1)^{\frac{1}{p}}}{(p\alpha_1 + 1)^{\frac{1}{p}}} \right). \end{aligned}$$

**Theorem 3.6.** Let  $I \subseteq \mathbb{R}$ . Suppose that  $f: [a, b] \subseteq I \rightarrow \mathbb{R}$  is a  $(\alpha_1, m)$ -convex function on  $[a, b]$  such that  $f \in L_1[a, b]$ . Then, we have the following inequality for Caputo-Fabrizio fractional integrals:

$$\begin{aligned} & ({}^{CF}I_a^\alpha |f|)(k) + ({}^{CF}I_b^\alpha |f|)(k) \\ & \leq \frac{2(1-\alpha)}{B(\alpha)} |f(k)| + \frac{\alpha(b-a)}{B(\alpha)} \times \\ & \left( \frac{|f(a)|(q + p(p\alpha_1 + 1)) + m |f(b)|(pq\alpha_1 + p(p\alpha_1 + 1))}{pq(p\alpha_1 + 1)} \right). \end{aligned}$$

where  $B(\alpha) > 0$  is normalization function  $q > 1, \frac{1}{q} + \frac{1}{p} = 1, m \in (0,1]$  and  $\alpha, \alpha_1 \in [0,1]$ .

**Proof :** By using the definition of convex function, we can write

$$f(ta + (1 - t)b) \leq t^{\alpha_1}f(a) + m(1 - t^{\alpha_1})f(b).$$

By taking the absolute values of both sides of the inequality, the integration is performed with respect to  $t$  in the interval  $[0,1]$ , then we have

$$\int_0^1 |f(ta + (1 - t)b)| dt \leq \int_0^1 t^{\alpha_1}|f(a)| dt + \int_0^1 (1 - t^{\alpha_1})m|f(b)| dt.$$

If we apply the Young's inequality to the right-hand side of the inequality, we get

$$\int_0^1 |f(ta + (1 - t)b)| dt \leq |f(a)| \left( \frac{1}{p} \left( \int_0^1 |t^{\alpha_1}|^p dt \right) + \frac{1}{q} \left( \int_0^1 1^q dt \right) \right) + m|f(b)| \left( \frac{1}{p} \left( \int_0^1 |1 - t^{\alpha_1}|^p dt \right) + \frac{1}{q} \left( \int_0^1 1^q dt \right) \right).$$

By using the fact that  $|1 - t^{\alpha}|^p \leq 1 - t^{p\alpha}$  for  $\alpha > 0, p > 1$ , we can write

$$\int_0^1 |f(ta + (1 - t)b)| dt \leq |f(a)| \left( \frac{1}{p} \left( \int_0^1 |t^{\alpha_1}|^p dt \right) + \frac{1}{q} \left( \int_0^1 1^q dt \right) \right) + m|f(b)| \left( \frac{1}{p} \left( \int_0^1 1 - t^{p\alpha_1} dt \right) + \frac{1}{q} \left( \int_0^1 1^q dt \right) \right).$$

By changing the variable as  $x = ta + (1 - t)b$  and by calculating the right hand side, we obtain

$$\frac{1}{b - a} \int_a^b f(x) dx \leq |f(a)| \left( \frac{1}{p} \left( \frac{1}{p\alpha_1 + 1} \right) + \frac{1}{q} \right) + m|f(b)| \left( \frac{1}{p} \left( \frac{p\alpha_1}{p\alpha_1 + 1} \right) + \frac{1}{q} \right).$$

By multiplying both sides of the above inequality with  $\frac{\alpha(b-a)}{B(\alpha)}$  and adding  $\frac{2(1-\alpha)}{B(\alpha)}|f(k)|$ , we have

$$\frac{2(1 - \alpha)}{B(\alpha)}|f(k)| + \frac{\alpha}{B(\alpha)} \int_a^b |f(x)| dx$$

$$\leq \frac{2(1 - \alpha)}{B(\alpha)}|f(k)| + \frac{\alpha(b - a)}{B(\alpha)} \times \left( |f(a)| \left( \frac{1}{p(p\alpha_1 + 1)} + \frac{1}{q} \right) + m|f(b)| \left( \frac{p\alpha_1}{p(p\alpha_1 + 1)} + \frac{1}{q} \right) \right).$$

By simplifying the inequality, we get

$$\left( \frac{1 - \alpha}{B(\alpha)}|f(k)| + \frac{\alpha}{B(\alpha)} \int_a^k |f(x)| dx \right) + \left( \frac{1 - \alpha}{B(\alpha)}|f(k)| + \frac{\alpha}{B(\alpha)} \int_k^b |f(x)| dx \right) \leq \frac{2(1 - \alpha)}{B(\alpha)}|f(k)| + \frac{\alpha(b - a)}{B(\alpha)} \times \left( |f(a)| \left( \frac{1}{p(p\alpha_1 + 1)} + \frac{1}{q} \right) + m|f(b)| \left( \frac{p\alpha_1}{p(p\alpha_1 + 1)} + \frac{1}{q} \right) \right).$$

After necessary operations, the proof is completed.
