---

#### **Abstract**

In this work, a list of the phytoplankton species in the Sea of Marmara is presented in the light of the previously conducted research. It was seen that totally 168 species, eight at the generic level, had been recorded from this region. Diatoms and Dinoflagellates were dominant in terms of species number, with 76 and 73 species, respectively. Diatoms represented the majority of the population (45.2%), followed by dinoflagellates (43.5%).

**Key words:** Phytoplankton, Species list, Sea of Marmara.

---

#### **Introduction**

The Sea of Marmara is a semi-enclosed basin located between the continents of Europe and Asia. It is connected to the Black Sea through the Bosphorus in the north-east and to the Aegean Sea via the Dardanelles in the south-west. The chemical oceanography of the Sea of Marmara is significantly influenced by the biochemistry of the Black Sea and the Aegean Sea. Because of the large volume of water inflow from the adjacent Black Sea (about  $600 \text{ km}^3$ ) into the relatively small upper layer volume (about  $225 \text{ km}^3$ ) of the Sea of Marmara, the upper layer ecosystem of the latter has been influenced to a large extent (Ünlüata *et al.*, 1990; Tuğrul and Polat, 1995). In particular, the basin is affected by the brackish water coming from the Black Sea. Phytoplankton composition, which possibly can be exposed to changes because of water flow, should be observed by new studies.

The list includes phytoplankton species found in the Sea of Marmara from 1974 to 2004. There are few data on phytoplankton (Kocataş *et al.*, 1993; Aubert *et al.*, 1990; Uysal, 1996; Uysal and Ünsal, 1996; Balkı, 2000, 2003 and Balkı *et al.*, 2004). The oldest data belong to Artüz (1974) and Bingel *et al.* (1986) according to Kocataş *et al.* (1993) and the most detailed studies were reported by Balkı (2003) and Balkı *et al.* (2004).

The main goal of this work is to list the phytoplankton species recorded up to this date and to provide species, of which taxonomy was changed according to modern system.

## Material and Methods

According to present literature, phytoplankton samples were collected with plankton nets or oceanographic bottles and preserved with lugol's iodine or neutralized formalin. The recent revisions of phytoplankton species are based on the studies of Huber-Pestalozzi (1983), Hasle and Syvertsen (1997), Steidinger and Tangen (1997), Throndsen (1997) and Heimdal (1997). The list of species within each Genus was organized in alphabetical order. In addition, synonyms in the references for the Sea of Marmara were noted in the list and authors were given under the species.

## Results

A total of 168 species, eight at the generic level, were identified: 2 Cyanophyceae, 73 Dinophyceae, 3 Prymnesiophyceae, 2 Chrysophyceae, 3 Dictyochophyceae, 76 Bacillariophyceae, 2 Euglenophyceae, 3 Prasinophyceae and 4 Chlorophyceae. Diatoms represented the majority of the population (45.2%), followed by dinoflagellates (43.5%). The genera *Chaetoceros* (diatom) and *Protoperidinium* (dinoflagellate) were dominant in terms of diversity.

Abbreviations used: L1, Aubert, *et al.* (1990); L2, Kocataş *et al.* (1993); L3, Uysal (1996); L4, Uysal and Ünsal (1996); L5, Balkı (2000); L6, Balkı (2003); L7, Balkı *et al.* (2004).

## CHLOROPHYTA

Classis: EUGLENOPHYCEAE

Order: Euglenales Engler

Family: Eutreptiaceae Hollande

Genus: *Eutreptiella* de Cunha

*Eutreptiella* sp.  
(L6, L7).

Family: Euglenaceae Dujardin  
Genus: ***Euglena*** Ehrenberg  
*Euglena viridis* Ehrenberg (Fresh water algae)  
(L7).

**Classis: PRASINOPHYCEAE**  
Order: Chlorodendrales Fritsch  
Family: Halosphaeraceae Haeckel  
Genus: ***Halosphaera*** Schmitz  
*Halosphaera viridis* Schmitz  
(L6, L7).

Genus: ***Pyramimonas*** Schmarda  
*Pyramimonas grossii* Parke  
(L6).  
Family: Chlorodendraceae Oltmanns  
Genus: ***Tetraselmis*** Stein  
*Tetraselmis* sp.  
(L6).

**Classis: CHLOROPHYCEAE**  
Order: Chlorococcales Marchand  
Family: Hydrodictyaceae Cohn  
Genus: ***Pediastrum*** Meyen  
*Pediastrum boryanum* (Turpin) Meneghini (Fresh water  
algae)  
(L7).  
*Pediastrum simplex* (Meyen) Lemm. (Fresh water algae)  
(L7).  
Family: Oocystaceae Bohlin  
Genus: ***Monoraphidium*** Komarkova-Legnerova  
*Monoraphidium* sp. (Fresh water algae)  
(L7).  
Family: Scenedesmaceae  
Genus: ***Scenedesmus*** Meyen  
*Scenedesmus quadricauda* (Turpin) Brébisson (Fresh water  
algae)  
(L7).

## **Discussion**

A total of 168 species have been identified from the Sea of Marmara as a result of previous studies. Kocataş *et al.* (1993) reported 42 species, four at the generic level. Aubert *et al.* (1990) mentioned 23 species, two at the generic level; Uysal (1986) 46 species, five at the generic level; Uysal and Ünsal (1996) 8 species and Balkış (2000) 5 species new to Turkish coastal waters from this region. The works of Uysal (1986) and Uysal and Ünsal (1996) are focused on the diatoms. The most detailed studies about phytoplankton in the Sea of Marmara were performed by Balkış (2003) and Balkış *et al.* (2004). Balkış (2003) reported 125 phytoplankton species, eight at the generic level, and Balkış *et al.* (2004) recorded 102 species, 13 at the generic level.

Taxa in the generic level were included in the list if the genera did not possess another species. Therefore, species number in the list differs from that in original papers of the authors.

Some fresh water algae reported by Balkış *et al.* (2004) were included in the list since they were indicators of less saline waters of different origins on the shelf. Balkış *et al.* (2004) reported that these species had been obtained in the area where Kocasu river flows to the sea.

This study has shown that a moderate number of phytoplankton species live in the Sea of Marmara and phytoplankton composition should be observed by new studies.

## **Özet**

Bu çalışmanın amacı, Marmara Denizi'ndeki fitoplankton türlerini, daha önce yapılmış araştırmaların ışığı altında bir liste halinde sunmaktadır. Bu bölgeden sekizi cins seviyesinde toplam 168 tür bildirilmektedir. Tür sayısı bakımından diatomlar (76 tür) ve dinoflagellatlar (73 tür) baskındır. Diatomlar populasyonun %45.2'sini, dinoflagellatlar ise %43.5'ini oluşturmaktadır.

## Acknowledgement

This work was supported by the Research Fund of Istanbul University, project number: BYP-417/06052004.
