La Revue "Communications de la Faculté des Sciences de l'Université d'Ankara" est un organe de publication englobant toutes les disciplines scientifiques représentées à la Faculté des Sciences de l'Université d'Ankara.

La Revue, jusqu'à 1975 à l'exception des tomes I, II, III était composé de trois séries

Série A: Mathématiques, Physique et Astronomie,

Série B: Chimie,

Série C: Sciences Naturelles.

A partir de 1975 la Revue comprend sept séries:

Série A₁: Mathématiques,

Série A₂: Physique,

Série A₃: Astronomie,

Série B: Chimie,

Série C₁: Géologie,

Série C₂: Botanique,

Série C₃: Zoologie.

A partir de 1983 les séries de C₂ Botanique et C₃ Zoologie ont été réunies sous la seule série Biologie C et les numéros de Tome commenceront par le numéro 1.

En principe, la Revue est réservée aux mémoires originaux des membres de la Faculté des Sciences de l'Université d'Ankara. Elle accepte cependant, dans la mesure de la place disponible les communications des auteurs étrangers. Les langues Allemande, Anglaise et Française seront acceptées indifféremment. Tout article doit être accompagnés d'un résumé.

Les articles soumis pour publications doivent être remis en trois exemplaires dactylographiés et ne pas dépasser 25 pages des Communications, les dessins et figures portes sur les feuilles séparées devant pouvoir être reproduits sans modifications.

Les auteurs reçoivent 25 extraits sans couverture.

Contribution to the Flora of Hazar Mountains (Elazığ)

E. YURDAKULOL* **Y. ALTAN****

(Received September 21, 1983, and accepted December 28, 1984)

ABSTRACT

The study was carried out from 1979 to 1981. The plants listed in this study cover the taxa collected from the Hazar Mountains located in the south of the Elazığ province.

The plants were listed in accordance with the sequence used by *Davis* in his book "Flora of Turkey". As a result of the study 636 species which belong to 329 genera and 75 families have been identified.

The distribution percentages of the species within the floristic regions are as follows: *Iran-Turanian* (30.0 %), *Mediterranean* (5.6 %), *Euro-Siberian* (4.4 %), *Endemics* (9.7 %), *Pluriregionals* (39.1 %), *Cosmopolis* (1.7 %) and *undecided* (9.5 %).

ÖZET

Bu çalışma 1979 ile 1981 yılları arasında tamamlandı. Çalışmanın bitki listesindeki taksonlar Elazığ İlinin güneyinde yer alan Hazar Dağlarından toplandı.

Bitkiler Davis'in "Flora of Turkey" adlı eserindeki sıraya göre listelendi. Çalışma sonucu 75 familya ve 329 cinsde 636 tür tespis edildi.

Floristik bölgeler arasında türlerin dağılış yüzdesi şöyledir: Iran-Turan (% 30.0), Akdeniz (% 5.6), Avrupa-Sibirya (% 4.4), Endemik (% 9.7), Çok Bölgeseli, (% 39.1), Kozmopolit (% 1.7) ve karar verilemeyecekler (% 9.5).

INTRODUCTION

The aim of this study was to find out the flora of this area which has not been properly studied before. A few botanists such as Prof.Dr. A. BAYTOP. (1), H.F. von HANDEL-MAZZETTI (4), Dr. A. HUBER-MORATH (5), Dr. P.H. DAVIS (9), P.E.E. SINTENIS (10), M. ZOHARY (11) have collected some material from the area.

* Department of Biology, Faculty of Science, University of Ankara.

** Department of Biology, Faculty of Science, University of Firat - Elazığ.

Therefore in this work, we tried to carry out a study of the flora of the Hazar Mountains. We hope that it will be useful.

THE STUDY AREA

The Hazar Mountains are located in the south-eastern part of the Elazığ province. The area of the Hazar Mountains is approximately 90 square kilometres. The mountain chains have several peaks, their altitudes vary from 1399 m to 2347 m.

According to the meteorological data (12), the annual mean precipitation is around 433.2 mm. The most rainy season of the area is spring. However, summer has a little amount of rain. The annual mean temperature is 13.0°C in the area. The mean maximum temperatures are seen in July (27.2°C) and August (27.0°C) whereas, the mean minimum is found in January (-1.3°C).

The steppe vegetation prevails in the study area. *Astragalus gummi-fer*, *A. kurdicus* var. *muchianus* and *Genista albida* communities are prominent in the vegetation.

MATERIAL and METHOD

The plants were collected monthly in different floristic periods of the vegetation from the study area in 1979 and 1980. Most of the species collected were identified by the authors and some of them were sent to the other taxonomists. For the identification many flora books were used by us such as: Boissier (13), Davis (9), Komarov (14), Rechinger (15), Townsend (16) and Tutin-Heywood (17). The plant samples are deposited in the herbarium of Firat University.

According to Davis's (9) grid system suggested in the "Flora of Turkey" volume I., the study area falls within B7 grid-square (Fig.1). The phytogeographical areas of the plants and endemics were revealed by using "Flora of Turkey" volumes I-VII. The plants belonging to more than two phytogeographical regions were considered as a pluriregional ones.

Although the species are given in alphabetical order, the rank of the families and genera were adopted from the *Flora*.

The numbers which follow the species name show the localities in the area studied (Fig.1). In the plant list we have used abbreviations that should be readily comprehensible.

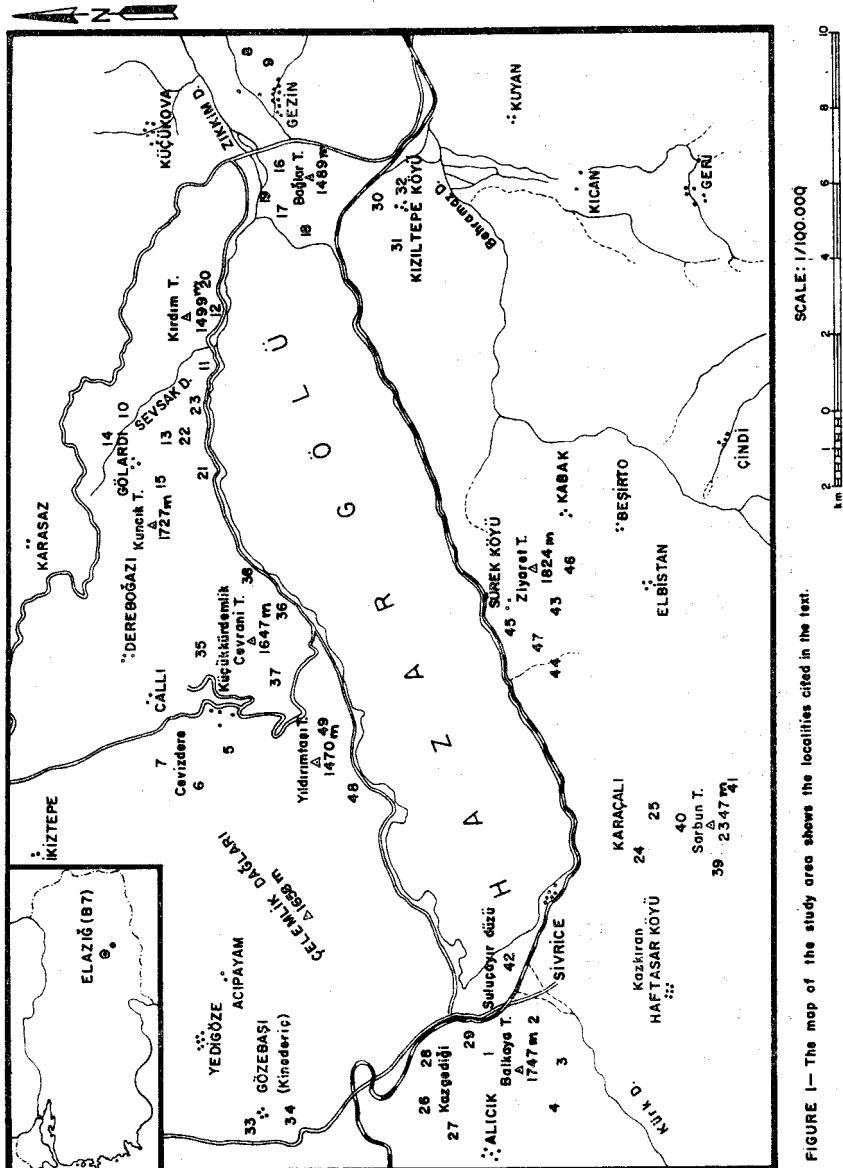

FIGURE 1—The map of the study area shows the localities cited in the text.

RESULTS

At the end of the study 603 species were identified from the study area. Two of them belong to the divisio of *Pteridophyta* and the remaining to the divisio of *Spermatophyta*. Thirty-three species given in the list were collected by the other botanists. The distribution percentage of the families of the Hazar Mountains Flora are as follows respectively: *Fabaceae* 82 (12.9 %), *Asteraceae* 78 (12.3 %), *Brassicaceae* 47 (7.4 %), *Lamiaceae* 39 (6.1 %), *Caryophyllaceae* 38 (6.0 %), *Poaceae* 38 (6.0 %), *Apiaceae* 30 (4.7 %), *Boraginaceae* 21 (3.3 %), *Rosaceae* 16 (2.5 %), *Ranunculaceae* 15 (2.3 %) and all the rest of the total 202 (31.7 %).

According to the results, the distribution percentages of the phytogeographic elements are as follows: *Irano-Turanian* 173 (30.0 %), *Mediterranean* 33 (5.6 %), *Euro-Siberian* 26 (4.4 %), *Endemics* 56 (9.7 %), *Cosmopolis* 10 (1.7 %), *Pluriregionals* 226 (39.1 %) and undecided 55 (9.5 %). As can be seen in the distribution percentages, *Irano-Turanian* phytogeographic elements are found to a quite high degree compared with the others.

Some species were adopted as new records on the basis of distributional data given by Baytop (1), Davis (9), Huber-Morath (5), and Sorger (18). As a result of the study, a hundred species were new records for B7 grid-square. These species were marked with an asterisks in the plant list.

Ten species were morphologically different from the typical ones given in the *Flora* (9). These differences also were mentioned in the plant list.
