### ABSTRACT

Studies on the valuation of biodiversity are mainly prepared with market value, non-market value, and ecosystem value. Thus, the contingent valuation method (CVM) is mostly used. The direct valuation of biodiversity almost does not exist. In this study, bird counts of Lake Erçek have complied, and the highest counted number for the species was used. The valuation of the avifauna was made using the compensation fees within the scope of the Turkish Central Hunting Commission Decisions 2020-2021. In Lake Erçek a total of 183 bird species were recorded, and the avifauna value was calculated as 203.084.660,00 TL.

**Keywords:** Biodiversity value, The Central Hunting Commission, Compensation fees.

## Erçek Gölü'nün (Van, Türkiye) Kuş Kiyometri

### ÖZET

Biyoçeşitliliğin kıymetlendirilmesi ile ilgili çalışmalar genel olarak piyasa kıymeti, piyasa dışı kıymet ve ekosistem kıymeti içermektedir. Bu nedenle, çoğunlukla koşullu kıymetlendirme yöntemi (CVM) kullanılır. Biyoçeşitliliğin kıymetlendirilmesi neredeyse yoktur. Bu çalışmada, Erçek Gölü'nün kuş sayımları derlenerek türler için en fazla sayılan sayı kullanılmıştır. Avifauna'nın kıymetlendirilmesi, 2020-2021 Türkiye Merkez Av Komisyonu Kararları kapsamındaki tazminat bedelleri kullanılarak yapılmıştır. Erçek Gölü'nde 183 kuş türü kaydedilmiş ve avifauna kıymeti 26.041.070,00 TL olarak hesaplanmıştır.

**Anahtar Kelimeler:** Biyoçeşitlilik kıymeti, Merkez Av Komisyon Kararları, Tazminat bedeli.

## 1. INTRODUCTION

Wetlands support goods and services to millions of people (Barbier et al., 1997; Ten Brink et al. 2012), and also the benefits it provides to the ecosystems is quite high (Joyce, 2012). The global value of wetlands, including goods and services, has been estimated at 14 trillion US \$ annually (Costanza et al., 1997).

Wetlands are highly sensitive ecosystems (Turner et al., 2000; Islam, 2010). Therefore, they are sensitive to degradation (Turner et al., 2000). Wetlands are endangered ecosystems, and increasing of the lost increase day by day (Barbier et al. 1997; Turner et al., 2000). Therefore, international and national legislations are existing to protect wetlands (Bergstrom and Stoll, 1993). Since 1900 more than half of the world's wetlands have been destroyed or lost (Barbier, 1993).

Economic valuation is used for correct decision making (Pearce et al., 1994). It demonstrates the benefits receiving from wetlands, the loss prices, and profits and incomes form land usage (Emerton, 1998). It eases decision making for better social well-being (Batie and Shabman, 1982), also promoting policies to protect the environment (Helm, 1991).

Although many studies have conducted on wetlands in Turkey, researches on their valuation almost do not exist (Biler and Altındağ, 2020). Wetland valuation is necessary to understand the importance of wetlands (Turpie et al., 2010).

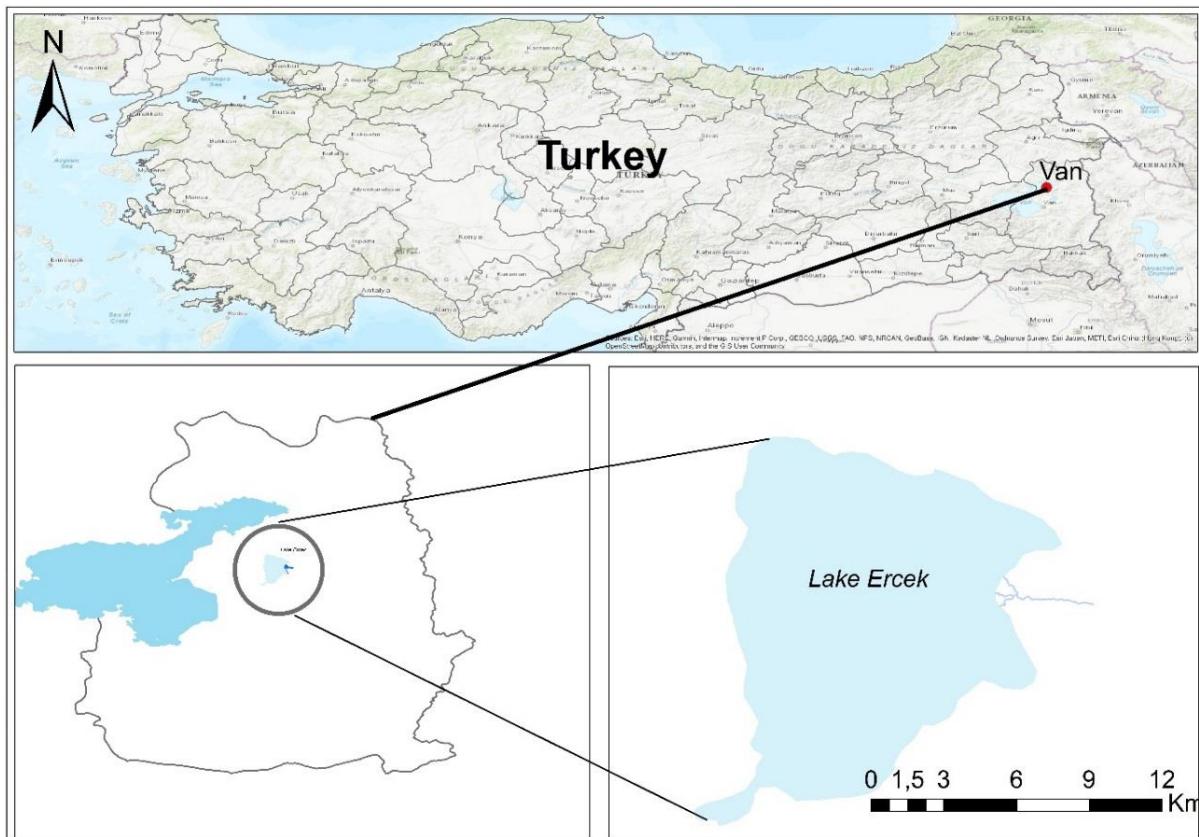

The valuation of biodiversity consists mainly of market value, non-market value, and ecosystem value (Gowdy, 1997). Also, biodiversity value is prepared using the contingent valuation method (CVM) (Turpie et al., 2010). There are only a few studies directly valuing biodiversity itself. The valuation of the species consists of the penalties according to the law (Biler and Altındağ, 2020). This research aims to value the avifauna of lake Erçek, using The Central Hunting Commission penalties of Turkey (2020-2021).

## 2. MATERIAL AND METHOD

### 2.1 Study Area

Lake Erçek is located between the coordinates 38°, 35 ' North; 43°, 33 East, and 20 km east of Lake Van (Figure 1). The depth of the lake is ranged from 30 - 38 m. The lake is 1890 m in altitude and covers 9520 ha (Adızel and Durmuş, 2009). There are 10 km wide flat meadows and arable lands on the southern and eastern shores of Lake Erçek. In the northern and western parts, the lake's waterline line is surrounded by high hills. Since the lake water is

salty and soda, it cannot be used in irrigation or meeting domestic needs (Sarı et al., 2000). Also Lake Erçek was registered by the Ministry of Agriculture and Forestry as a wetland of national importance on 10.06.2016 covering 22.269 ha.

**Figure 1.** Geographic location of the study area

## 2.2 Bird Counts

Data on the bird counts of Lake Erçek is taken from Adızel and Durmuş (2009), Durmuş and Çelik (2017), Nergiz and Durmuş (2018), eBird counts and mid-winter waterfowl counts (MWWC) prepared by the Turkish Ministry of Agriculture and Forestry.

## 2.3 Value with the Turkish Central Hunting Commission compensation fees (2020-2021)

The valuation of the avifauna was made using the compensation fees within the scope of the Central Hunting Commission Decisions determined by the Turkish Republic Ministry of Agriculture and Forestry.

### 3. RESULTS AND DISCUSSION

179 bird species were recorded according to Adızel & Durmuş (2009), 1 species by Nergiz & Durmuş (2018), 21 species by MWWC counts and 183 species by Ebird counts. The highest counted number for the species was used, and 1 for the species without observation counts was written. A total of 183 bird species in Lake Erçek were recorded and the value is calculated as 203.084.660,00 TL. Accordingly, species list, counts, and compensation fees are given in Table 1.

**Table 1.** Avifauna list, counts and compensation fees

Scientific Name	Common Name	Adızel & Durmuş (2009) counts	Nergiz & Durmuş (2018) counts	Max. MWWC counts	Max. Ebird counts	Max. Individuals counted	Compensation fee (in TL)
<i>Cettia cetti</i>	Cetti's Warbler	3		1	3	1.671.050,00

There are two studies in Turkey related to the biodiversity valuation by the compensation fees of the National Hunting Law. The first was prepared by the Ministry of Agriculture and Forestry in the Sultan Sazlıgı National Park in 2012. According to this research, the birds' value of Sultan Sazlıgı National Park was calculated as 71.120.300 TL (Anonymous, 2012). Biler and Altındağ (2020) calculated in his article the value of Balıkdamı Wetland's birds as 4.095.550 TL. We calculated the birds' value of Lake Erçek as 203.084.660,00 TL. The value depends mostly on the bird migration routes and the size of the area. Sultan Sazlıgı National Park is the largest area, whereas Balıkdamı Wetland is the smallest. Therefore, it is an expected result that the area that the birds visit more intensely will be valued high. The calculation for lake Erçek differs from the other studies, due to the change in the compensation fees. The bird value of lake Erçek was excepted to be between Sultan Sazlıgı National Park and Balıkdamı Wetland.

#### 4. CONCLUSION

Wetland ecosystems have not been considered historically for conservation and have been regarded as waste areas. Its ecological functions and the values to society are not fully understood. On the other hand, Turkey has many important stopover sites on migration (Karaardıç et al. 2006a; Erdoğan et al. 2008) and many populations breeding in the western Palearctic region prefer to migrate to the sub-Saharan areas in eastern Africa for wintering via Turkey (Karaardıç et al. 2006b; Meier et al. 2020). Wetlands offer important hiding, resting and

feeding opportunities for both wintering and long-distance migratory birds (Erciyas et al. 2010; Karaardıç & Özkan, 2017; Karaardıç & Erdoğan, 2019). Economic valuation may be easier to understand the recent and the future situation according to these relations in ecosystems, especially in wetland ecosystems, considering that more than half of the wetlands have disappeared or changed in the last century (Barbier, 1993). Moreover, concrete data will help to make true conservation strategies. It is essential to introduce these useful ecosystems to the local people, as well as raise awareness about their importance and conservation. In addition, it is important to reveal wetland value for the development of wetland policies. The importance of bird value is due to the responsibilities of the countries included in the Ramsar Convention. For this reason, in this study, the birds' value of Lake Erçek was revealed, and it is emphasized that it should be taken into consideration in the planning of the area.
