La Revue "Communications de la Faculté des Sciences de l'Université d'Ankara" est un organe de publication englobant toutes les disciplines scientifiques représentées à la Faculté.

La Revue, jusqu'a 1975 à l'exception des tomes I, II, III, était composée de trois séries:

Série A: Mathématique, Physique et Astronomie.

Série B: Chimie.

Série C: Sciences naturelles.

A partir de 1975 la Revue comprend sept séries:

Série A₁: Mathématique

Série A2: Physique

Série A₃: Astronomie

Série B: Chimie

Série C₁: Géologie

Série C2: Botanique

Série C3: Zoologie

En principe, la Revue est réservée aux mémoires originaux des membres de la Faculté. Elle accepte cependant, dans la mesure de la place disponible, les communications des auteurs étrangers. Les langues allemande, anglaise et française sont admises indifféremment. Les articles devront être accompagnés d'un bref sommaire en langue turque.

(Received 25 September 1978, and accepted 31 October 1978)

ABSTRACT

The complex methylene pmr spectra of some α - dinitrophenyl- β - keto esters is explained in terms of chirality of the molecules due to hindered rotation about aromatic carbon-aliphatic carbon bond. pmr and cmr data is reported in order to prove the conclusions.

INTRODUCTION

The NMR spectra of compounds which contain the groups – CH_2 X– or $-C(CH_3)_2$ X have been investigated by numerous authors and an excellent review of the subject has been given by Raban and Mislow¹. Molecules which are chiral but not asymmetric may contain diastereotopic groupings. Nuclei which are diastereotopic must have different chemical shifts in either chiral or chiral solvents. Such nuclei are said to be anisochronous such as diethyl sulfite², cyclocarbinyl ethyl ether³ offer striking examples of magnetic nonequivalence of methylene hydrogens in compounds of the type R-CH₂ –O–CR₁ R₂ R₃. Thus the pmr spectra of such methylene protons are often typical of AB rather then A₂ systems.¹

In our studies, the investigation of enolisation of α -dinitrophenyl- β -keto esters by pmr we observed that the some of enolic form of said molecules exhibit complex methylene spectra and that was explained in terms of chirality due to the hindered rotation about aromatic carbon-enolic carbon bond.

Figure-I. 60 MHz pmr spectra of x-2, 4-dinitrophenyl ethylacetoacetate in CDCl₃ (5 % Wt/vol) 40 °C Ofset 360 Hz.

RESULTS AND DISCUSSIONS

Regarding both cmr and pmr spectra it seems strongly justified that α -dinitropbenyl- β -keto esters are at least 90 % enolic (Figure-1). However in strongly acidic solvents keto content of such molecules increase up to 40 % (Figure-II).

It is now also proved that enol from of α - 2, 4-dinitropbenyl- β -keto esters exhibit bipbenyl-like-isomerism⁵ due to the chelation of β -keto esters obviously behave as a plane which would be prevented to rotate about aromatic carbon-enolic carbon bond.

Chirality of the molecule arises from the chelate ring of the $\beta-$ keto esters becouse of the observation that in the presence of piperidin the complex ABC_3 spectra of compound-I simplified to A_2B_3 spectra due to intra moleculer proton transfer which derease the stability of chelate ring resulting the rotation about the $C\alpha-COOR$ bond.

Hence, two rings in compound-I and II could not be coplanar due to impingment of the o-nitro group of phenyl ring as well as 1, 3-substituents of chelate ring.

An O-substituent of one ring thus is located above the plane of the second ring, and if the second ring holds two different o-groups or 1, 3-substituents the substituents on the first ring is in an asymmetric environment. If that substituents contains methylene group its two protons thus become diastereotopic. Therefore methylene protons on ethoxy groups of $\alpha-2$, 4-dinitrophenyl- β -keto ethyl esters are diastereotopic and hence anisocronous. In such a case ABC₃ (or ABX₃) spin systems are expected and observed. Diastereotopic methylene protons resides in different environment even though the substituent rotates about chelate ring-substituent bond. The conformers of the ethoxy group about that bond (e.g., Ia-d Fig. III) will not necessarily be equally populated and the environments of the two protons are different in each conformer.

Figure - III. Conformers of chiral α- dinitrophenyl-β- keto esters

This could be seen from the pmr spectra of $\alpha-2$, 4-dinitrophenyl acetoacetate (compound-I) in wich the pmr spectra of such methylene protons typical AB rather than A_2 systems and complex spectra characteristic of AB part of ABC₃ spectra. The chemical shift between the two anisochronous protons $\Delta\delta_{AB}$ varies from 2 Hz to 11 Hz depending on the solvent and the structure of compound at 60 MHz with methyl-methylene coupling constants ca. 7, 0 Hz (Table-II).

After series of iterative calculations it was also demonstrated that methylene spectrum of compound-I could be fitted to with in experimental eror although there is a lower limit to $\Delta \delta_{AB}$ below which instrument resolution do not permit us. Therefore it was

Table – I. Chemical Shifts and Coupling Constants of Ethoxyl Protons of chrial α - dinitrophenyl – β - keto esters, Compound-I and II in CDC1₃, 40°C, Values Hz down field from intermal TMS at 60 MHz.

| Compound | R | R' | δH_{A} | δH_{B} | $\triangle \delta H_{AB}$ | J_{AB} | δ_{C} |
|----------|---|-----------------|----------------|----------------|---------------------------|----------|-----------------------|
| Ī | CH ₃ | CH ₃ | 246.2 | 255.6 | 9.4 | 10.5 | 70 |
| II | NO ₂ C ₆ H ₄ | CH^3 | 250.0 | 261.0 | 11.0 | 10.0 | 72 |

estimated ca. 2 Hz was the minimum value for the separations in theoretically calculated spectra (Figure-IV). Signs of coupling constants are, of course, assigned by analogy⁸ (Figure-IV).

The origin of this magnetic nonequivalance has been subject of several investigations and two distinct chemical shift effects have been reported^{1,2} a). An intrinsic assymetry effect independent of rotamer populations b). Shift differences coused by dissimilar populations of various conformations or rotamers. It is still in question whether the former or the latter is alone responsible for magnetic nonequivalance. However, in our case effect of hindered rotations in the molecule is quite apparent.

Therefore we also examined pmr spectra of the similar compounds. The simple A_2B_3 methylene spectra of α – 2, 6-dinitrophenyl- β -keto esters (compound – III, IV) strongly proves that anisochronous behavior of methylene protons determined by the dissimilar o-substituents just as in biphenyl isomerism, similarly, 3– (2, 4-dinitrophenyl)-2, 4-pentandion (V) and α – 2, 4-dinitrophenylethylcyanoacetate (VI) give simple A_2B_3 spectra of ethyl group although the fact that the molecule is asymmetrical and likely to be the racemic mixture. It is also interesting to note that α – (2, 4-dinitrophenyl)-t-butyl acetoacetate (VII) gives a line from t-butyl group-due to the enantiotopic methyl groupsindicating that contribution of rotamers about the oxygen-carbon bond is quite significant on magnetic nonequivalence (Table-II), (Figure-III) which is although not affected from the rotations about oxygen-carbonyl bond that seems also restricted.

The most important factor for the magnitudes of the shift differences anisotropy associated with phenyl ring, nitro groups as well as ansaturated chelate ring. The ¹³C magnetic resonance spectra of compound-I and II was also examined (Table-III).

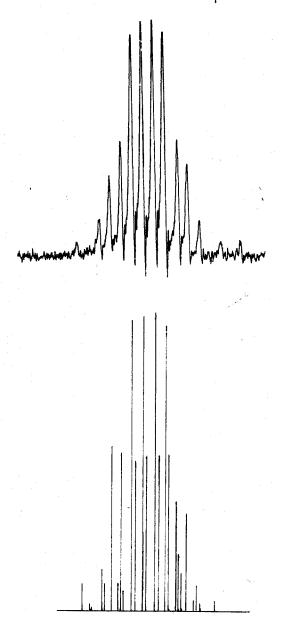

Figure-IV. Observed and calculated pmr spectra of 10 %/wt/vol solution of α - 2, 4-dinitrophenyl ethyl acetoacetate in CDCl₃ at 60 MHz TMS as an internal reference taken taken as zero.

ÖZET

α— dinitrofenil – β— keto esterlerin metilen grubunun karmaşık pmr spektrumunun kaynağı tartışılmış ve alifatik-aromatik karbon atomları arasındaki bağın etrafındaki dönmenin yapısal engellemeler nedeni ile sınırlandığı ve "bifenil" izomerlerine benzer "chiral" bir yapı oluşturduğu bu nedenle metilen protonlarının "diasterotopik" olarak davrandıkları anlaşılmıştır. Ayrıca bazı moleküllerde teorik yaklaşımlar ile pmr sabitleri bulunmuş denel sonuçlar ile karşılaştırılmışlardır.
