The Transmittal-Characteristic Function of Three-Interval Periodic Sturm-Liouville Problem with Transmission Conditions

Kadriye Aydemir¹, Oktay Mukhtarov²

Abstract — In this paper, we study the periodic Sturm-Liouville problem, defined on three non-intersecting intervals with four supplementary conditions which are imposed at two internal points of interaction, the so-called transmission conditions. We first prove that the eigenvalues are real and the system of eigenfunctions is an orthogonal system. Secondly, some auxiliary initial-value problems are defined and transmittal-characteristic function is constructed in terms of solutions of these initial-value problems. Finally, we establish that the eigenvalues of the considered problem are the zeros of the transmittal-characteristic function.

Keywords — Periodic transmittal Sturm-Liouville problem, characteristic function, spectrum

Mathematics Subject Classification (2020) — 34B24, 34L15

1. Introduction

This paper is aimed at studying a discontinuous spectral problem consisting of the three-interval Sturm-Liouville equation

\[ \Xi_\lambda y := -y''(x) + q(x)y = \lambda y(x) \quad x \in [\overline{c}_1, c_1] \cup (c_1, c_2) \cup (c_2, \overline{c}_2] \]  

the periodic boundary conditions

\[ \ell_1 y := y(\overline{c}_1) - y(\overline{c}_2) = 0 \]  
\[ \ell_2 y := y'(\overline{c}_1) - y'(\overline{c}_2) = 0 \]

and supplementary transmission conditions, which are imposed at the points of interaction \( c_1 \) and \( c_2 \), given by

\[ \ell_3 y := y(c_1) + y(c_1^+) = 0 \]  
\[ \ell_4 y := y'(c_1) + y'(c_1^+) = 0 \]

and

\[ \ell_5 y := y(c_2) - \beta y(c_2^+) = 0 \]  
\[ \ell_6 y := y'(c_2) - \frac{1}{\beta} y'(c_2^+) = 0 \]

respectively, where \( q(x) \) is a real-valued function, \( \lambda \in C \) is a complex spectral parameter and the coefficient \( \beta \neq 0 \) is real numbers. In investigating the periodic flow in a rod, C. Sturm and J. Liouville

²Department of Mathematics, Faculty of Arts and Sciences, Tokat Gaziosmanpaşa University, Tokat, Turkey
in the first half of the 19th century were led to the definition of class of Sturm-Liouville problems consisting of self-adjoint linear differential equation of the form

\[- \frac{d}{dx} \left( K(x) \frac{dF(x)}{dx} \right) + \ell(x)F(x) = \lambda q(x)F(x) \quad \text{for } x \in [a, b] \tag{8}\]

together with the boundary conditions of the form

\[ K(a)F'(a) - hF(a) = 0 \tag{9}\]
\[ K(b)F'(b) - HF(b) = 0 \tag{10}\]

They obtained some results that characterized by the general and qualitative nature of the solutions. They also proved that there exists infinitely countable number of values \( \lambda_1, \lambda_2, \ldots \) of spectral parameter \( \lambda \) with the corresponding non-trivial solutions \( F_1(x), F_2(x), \ldots \), the so-called eigenfunctions, and discussed the qualitative behavior of these eigenvalues and eigenfunctions, such as the asymptotics of eigenvalues, the zeros of the eigenfunctions that could be used in a variety of physical situations. These results have inspired much of branches of modern analysis and spectral theory of linear differential and integral operators, and continue to do so. The existence of periodic and oscillatory eigenfunctions important in the spectral theory of differential operators. We know that periodic boundary value problems of Sturm-Liouville type have been widely investigated due to their application in physics and engineering. For example, consider the heated string bent into a circle. Since the two ends of this string are physically the same, we would expect that the temperature and the temperature gradient to be equal at these endpoints. This situation is modelled by boundary conditions of the form

\[ u(a) = u(b), \quad u'(a) = u'(b) \]

which are called periodic boundary conditions.

Periodic Sturm-Liouville problems for various type differential equations have been studied extensively in the literature (see, for example, [1–5] and references therein). In the paper [2], the authors considered the problem

\[
\begin{cases}
-u'' + h(s)u = \lambda g(s, u), & 0 \leq s \leq \pi \\
u(0) = u(2\pi), \quad u'(0) = u'(2\pi)
\end{cases}
\]

and

\[
\begin{cases}
u'' + h(s)u = \lambda g(s, u), & 0 \leq s \leq \pi \\
u(0) = u(2\pi), \quad u'(0) = u'(2\pi)
\end{cases}
\]

where \( h \in L^1(0, 2\pi), g : [0, 2\pi] \times \mathbb{R}^+ \to \mathbb{R}^+ \) is continuous, \( \lambda \) is a positive parameter. In the work [3], a new existence theorems for a nonlinear periodic boundary value problem of first-order differential equations with impulses are established. In the article [4], the topological degree theory is applied to show the existence of positive solutions to the periodic Sturm-Liouville problem. In the paper [5] the eigenvalues of regular periodic and semi periodic Sturm-Liouville problems are considered. Binding and Rynne [6] considered the nonlinear Sturm-Liouville problem

\[
\begin{cases}
(-\rho y)'' + ay = ay^+ - by^- + \lambda y \\
y(0) = y(2\pi), \quad (\rho y)'(0) = (\rho y)'(2\pi)
\end{cases}
\]

where \( \frac{1}{\rho}, \rho \in L^1(0, 2\pi) \) with \( \rho > 0 \) on \((0, 2\pi)\), \( a, b \in L^1(0, 2\pi) \) \( \lambda \) is a real parameter, and \( y^+(t) = \max\{\pm y(t), 0\} \) for \( t \in [0, 2\pi] \). It is showed that a sequence of half-eigenvalues exists and obtained degree theoretic properties associated with set of half-eigenvalues. In recent years, many spectral properties of periodic Sturm-Liouville problems have been studied and many techniques have been developed by many authors (see [7–16] ).

Boundary value problems including transmission conditions appears in many fields of natural sciences. Recently, such type of transmission problems have been an important topic in theoretical and applied mathematics (see, [17–28]). In this study we will investigate some basic spectral properties of a new type periodic Sturm-Liouville problems. Namely, the differential equations are defined on
Theorem 2.3. Let \( \lambda \) be an eigenvalue of the considered problem (1) – (7) with an eigenfunction \( \psi \). Taking the complex conjugate and note that the coefficient \( \beta \) is real, we arrive at

\[
-\psi''(x) = \lambda \psi(x)
\] (11)

\[
\psi(c_1^-) = \psi(c_2^-), \quad \psi'(c_1^-) = \psi'(c_2^-)
\] (12)

\[
\psi(c_1^+) = \psi(c_2^+), \quad \psi'(c_1^+) = \psi'(c_2^+)
\] (13)

\[
-\psi(c_2^+) = \beta \psi(c_2^+), \quad \psi'(c_2^+) = \frac{1}{\beta} \psi'(c_2^+)
\] (14)

This implies that \( (\lambda, \psi) \) is also an eigen pair for the problem (1) – (7). By the previous theorem we have

\[
0 = (\lambda - \overline{\lambda})(\int_{c_1^-}^{c_1^+} \psi(x)\psi(x)dx + \int_{c_2^-}^{c_2^+} \psi(x)\psi(x)dx + \int_{c_1^-}^{c_2^-} \psi(x)\psi(x)dx)
\]

\[
= (\lambda - \overline{\lambda})(\int_{c_1^-}^{c_1^+} |\psi(x)|^2 dx + \int_{c_2^-}^{c_2^+} |\psi(x)|^2 dx + \int_{c_1^-}^{c_2^-} |\psi(x)|^2 dx)
\] (15)

Since \( \psi \), being an eigenfunction, is not identically equal to zero on \([c_1, c_2] \cup (c_1, c_2) \cup (c_2, c_2)\]

\[
\int_{c_1^-}^{c_1^+} |\psi(x)|^2 dx + \int_{c_2^-}^{c_2^+} |\psi(x)|^2 dx + \int_{c_1^-}^{c_2^-} |\psi(x)|^2 dx > 0
\]

So, \( \lambda = \overline{\lambda} \). Thus \( \lambda \) is real. The proof is complete. \( \Box \)

Remark 2.2. Since all eigenvalues of the considered problem (1) – (7) are real, without loss of generality we can now assume that the corresponding eigenfunctions are also real-valued.

Theorem 2.3. Let \( \lambda_k \) and \( \lambda_r \) are two distinct eigenvalues of the problem (1) – (7) on \([c_1, c_2] \cup (c_1, c_2) \cup (c_2, c_2)\), then their corresponding eigenfunctions \( \psi_k \) and \( \psi_r \) satisfy the following equality

\[
\int_{c_1^-}^{c_1^+} \psi_k(x)\psi_r(x)dx + \int_{c_2^-}^{c_2^+} \psi_k(x)\psi_r(x)dx + \int_{c_1^-}^{c_2^-} \psi_k(x)\psi_r(x)dx = 0
\] (16)

that is the eigenfunctions \( \psi_k \) and \( \psi_r \) are orthogonal in the Hilbert space \( L_2((c_1, c_2) \oplus (c_1, c_2) \oplus (c_2, c_2)) \).

Proof. Since \( \psi_k \) and \( \psi_r \) are eigenfunctions corresponding to the eigenvalues \( \lambda_k \) and \( \lambda_r \) respectively, we have

\[
-\psi''_k(x) = \lambda_k \psi_k(x)
\] (17)
and
\[-\psi''_r(x) = \lambda_r \psi_r(x)\]  \hspace{1cm} (18)

Multiplying (17) by \(\psi_r\) and (18) by \(\psi_k\), then subtracting we get

\[
(\lambda_k - \lambda_r) \left( \int_{c_1^-}^{c_1^+} \psi_k(x) \psi_r(x) dx + \int_{c_2^-}^{c_2^+} \psi_k(x) \psi_r(x) dx + \int_{c_2^+}^{\gamma_2} \psi_k(x) \psi_r(x) dx \right) = (\psi'_k \psi_r - \psi'_r \psi_k)^\bigg|_{c_1^-}^{c_1^+} + (\psi'_k \psi_r - \psi'_r \psi_k)^\bigg|_{c_2^-}^{c_2^+} + (\psi'_k \psi_r - \psi'_r \psi_k)^\bigg|_{c_2^+}^{\gamma_2}.
\]  \hspace{1cm} (19)

By using the boundary and transmission conditions we find

\[
(\lambda_k - \lambda_r) \left( \int_{c_1^-}^{c_1^+} \psi_k(x) \psi_r(x) dx + \int_{c_2^-}^{c_2^+} \psi_k(x) \psi_r(x) dx + \int_{c_2^+}^{\gamma_2} \psi_k(x) \psi_r(x) dx \right) = 0.
\]  \hspace{1cm} (20)

Since \(\lambda_k \neq \lambda_r\) we get the equality (16).

\[\Box\]

**Theorem 2.4.** The periodic problem (1) – (7) is self-adjoint.

**Proof.** Consider the periodic Sturm-Liouville problem (1)–(7). Let \(u, \vartheta \in C^2_2([\gamma_1, c_1) \cup (c_1, c_2) \cup (c_2, \gamma_2])\) that satisfies the periodic eigenvalue problem (1)–(7). We shall prove that

\[
\int_{\gamma_1}^{c_1^-} [u \Xi \vartheta - \vartheta \Xi u] dx + \int_{c_1^+}^{c_2^-} [u \Xi \vartheta - \vartheta \Xi u] dx + \int_{c_2^+}^{\gamma_2} [u \Xi \vartheta - \vartheta \Xi u] dx = 0.
\]

By using the definition of the differential operator \(\Xi\) we can show that

\[
\vartheta \Xi u - u \Xi \vartheta = \frac{d}{dx}(\vartheta u' - u \vartheta').
\]

Now integrating by parts over \([\gamma_1, c_1) \cup (c_1, c_2) \cup (c_2, \gamma_2]\) we obtain

\[
\int_{\gamma_1}^{c_1^-} [\vartheta \Xi u - u \Xi \vartheta] dx + \int_{c_1^+}^{c_2^-} [\vartheta \Xi u - u \Xi \vartheta] dx + \int_{c_2^+}^{\gamma_2} [\vartheta \Xi u - u \Xi \vartheta] dx = (\vartheta u' - u \vartheta')|_{\gamma_1}^{c_1^-} + (\vartheta u' - u \vartheta')|_{c_1^+}^{c_2^-} + (\vartheta u' - u \vartheta')|_{c_2^+}^{\gamma_2}.
\]  \hspace{1cm} (21)

To satisfy the conditions (2)–(3) we get

\[
u(\gamma_1) = \nu(\gamma_2), \quad \nu'(\gamma_1) = \nu'(\gamma_2)
\]

and

\[
\vartheta(\gamma_1) = \vartheta(\gamma_2), \quad \vartheta'(\gamma_1) = \vartheta'(\gamma_2).
\]

By using this equalities we find

\[
W(u, \vartheta; \gamma_1) - W(u, \vartheta; \gamma_2) = 0 \hspace{1cm} (22)
\]

Similarly by using the transmission conditions (4)–(7) we obtain

\[
W(u, \vartheta; c_1^-) - W(u, \vartheta; c_1^+) = 0 \hspace{1cm} (23)
\]
Finally, we can define the solution \( \phi \) which completes the proof.

Substituting the equalities (22), (23), (24) in (21) we get

\[
\int_{c_1}^{c_2} [\vartheta \Xi \lambda u - u \Xi \lambda \vartheta]dx + \int_{c_1}^{c_2} [\vartheta \Xi \lambda u - u \Xi \lambda \vartheta]dx + \int_{c_1}^{c_2} [\vartheta \Xi \lambda u - u \Xi \lambda \vartheta]dx = 0
\]

which completes the proof. \( \square \)

3. The Transmittal-Characteristic Function

Consider the initial value problem

\[
- y'' + q(x)y = \lambda y, \quad x \in (\alpha_1, \alpha_2)
\]

(25)

\[
y(\alpha + 0) = r(\lambda), \quad y'(\alpha + 0) = s(\lambda)
\]

(26)

where \( r, s : \mathbb{C} \to \mathbb{C} \) are given complex functions. Using the method in [29], we can prove the following Lemma.

**Lemma 3.1.** Assume that the real valued function \( q(x) \) is continuous on \((\alpha_1, \alpha_2)\) and the complex functions \( r(\lambda), s(\lambda) \) are differentiable on whole complex plane \( \mathbb{C} \) (i.e. \( r(\lambda) \) and \( s(\lambda) \) are entire functions). Then, the initial value problem (25)-(26) has an unique solution \( y = y(x, \lambda) \) which is an entire function of \( \lambda \) for each fixed \( x \in (\alpha_1, \alpha_2) \).

Let us construct two basic solutions

\[
\varphi(x, \lambda) = \begin{cases} 
\varphi_1(x, \lambda), & x \in [\bar{c}_1, c_1) \\
\varphi_2(x, \lambda), & x \in (c_1, c_2) \\
\varphi_3(x, \lambda), & x \in (c_2, \bar{c}_2]
\end{cases}, \quad \chi(x, \lambda) = \begin{cases} 
\chi_1(x, \lambda), & x \in [\bar{c}_1, c_1) \\
\chi_2(x, \lambda), & x \in (c_1, c_2) \\
\chi_3(x, \lambda), & x \in (c_2, \bar{c}_2]
\end{cases}
\]

according to the following iterative technique. First, we define the solution \( \varphi_1(x, \lambda) \). Let \( \varphi_1(x, \lambda) \) be the solution of the equation (1) on \( \Omega_1 := [\bar{c}_1, c_1) \) subject to the initial conditions

\[
y(\bar{c}_1) = 1, \quad y'(\bar{c}_1) = 0
\]

(27)

Second, we shall define the solution \( \varphi_2(x, \lambda) \) of Eq. (1) on \( \Omega_2 := (c_1, c_2) \) by means of the solution \( \varphi_1(x, \lambda) \) chosen so as to satisfy the initial conditions

\[
y(c_1^-) = \varphi_1(c_1^-, \lambda), \quad y'(c_1^-) = \varphi_1'(c_1^-, \lambda)
\]

(28)

Finally, we can define the solution \( \varphi_3(x, \lambda) \) of Eq. (1) on \( \Omega_3 := (c_2, \bar{c}_2] \) by means of the solution \( \varphi_2(x, \lambda) \) satisfying the initial conditions

\[
y(c_2^+) = \frac{1}{\beta} \varphi_2(c_2^+, \lambda), \quad y'(c_2^+) = \beta \varphi_2'(c_2^+, \lambda).
\]

(29)

Using the same iterative technique as in defining the solutions \( \varphi_1(x, \lambda) \), \( \varphi_2(x, \lambda) \) and \( \varphi_3(x, \lambda) \), we construct other solutions \( \chi_1(x, \lambda) \), \( \chi_2(x, \lambda) \) and \( \chi_3(x, \lambda) \) as a solution to the Eq.(1) chosen as to satisfy the initial conditions

\[
y(\bar{c}_1) = 0, \quad y'(\bar{c}_1) = 1
\]

(30)

\[
y(c_1^-) = \chi_1(c_1^-, \lambda), \quad y'(c_1^-) = \chi_1'(c_1^-, \lambda).
\]

(31)
and
\[ y(c_2^+) = \frac{1}{\beta} \chi_2(c_2^-, \lambda), \quad y'(c_2^+) = \beta \chi_2'(c_2^-, \lambda) \]
respectively. By virtue of the Lemma 3.1, each of the solutions \( \varphi_i(x, \lambda) \) and \( \chi_i(x, \lambda) (i = 1, 2, 3) \) exists, unique for any fixed \( \lambda \) and is an entire function with respect to the complex variable \( \lambda \) for any fixed \( x \).

**Theorem 3.2.** Each of the pair \( \varphi_i(x, \lambda), \chi_i(x, \lambda) \) is linearly independent solutions of Eq. (1) on the interval \( \Omega_i \), where \( \Omega_1 = [\overline{a}_1, c_1), \Omega_2 = (c_1, c_2), \Omega_3 = (c_2, \overline{b}_2]. \)

**Proof.** To prove it is sufficient to show that the Wronskians
\[ W_\lambda(\varphi_1, \chi_1; x) =: \varphi_i(x, \lambda)\chi_i'(x, \lambda) - \varphi_i'(x, \lambda)\chi_i(x, \lambda) \]
are not equal to zero on \( \Omega_i \).

Since the Wronskians \( W_\lambda(\varphi_i, \chi_i; x) \) does not depend on variable \( x \), Using the initial conditions (27 and (30) we have
\[ W_\lambda(\varphi_1, \chi_1; x) = W_\lambda(\varphi_1, \chi_1; \overline{a}_1) = 1 \neq 0. \]
Using (28), (31) and (33)
\[ W_\lambda(\varphi_2, \chi_2; x) = W_\lambda(\varphi_2, \chi_2; c_1^+) \]
\[ = \varphi_2(c_1^+, \lambda)\chi_2'(c_1^+, \lambda) - \varphi_2'(c_1^+, \lambda)\chi_2(c_1^+, \lambda) \]
\[ = \varphi_1(c_1^+, \lambda)\chi_1'(c_1^+, \lambda) - \varphi_1'(c_1^+, \lambda)\chi_1(c_1^+, \lambda) \]
\[ = W_\lambda(\varphi_2, \chi_1; c_1^+) = W_\lambda(\varphi_1, \chi_1; \overline{a}_1) = 1 \neq 0. \]
Similarly, using (29), (32) and (34) we get
\[ W_\lambda(\varphi_3, \chi_3; x) = W_\lambda(\varphi_3, \chi_3; c_2^+) \]
\[ = \varphi_3(c_2^+, \lambda)\chi_3'(c_2^+, \lambda) - \varphi_3'(c_2^+, \lambda)\chi_3(c_2^+, \lambda) \]
\[ = W_\lambda(\varphi_3, \chi_3; \overline{b}_2) = 1 \neq 0. \]
The proof is complete.

**Theorem 3.3.** A complex number \( \lambda \) is an eigenvalue of the transmittal-periodic problem (1)-(7) if and only if
\[ \Delta(\lambda) := W_\lambda(\varphi_2, \chi_2; c_1^+)W_\lambda(\varphi_2, \chi_2; c_2^+)W_\lambda(\varphi_3, \chi_3; \overline{a}_1) + 1 - \varphi_3(\overline{b}_2) - \chi_3'(\overline{b}_2) = 0. \]

**Proof.** Let \( y_0(x, \lambda_0) \) be any eigenfunction belonging to the eigenvalue \( \lambda_0 \). It follows from the Theorem 3.2 that the solutions \( \varphi_i(x, \lambda_0) \) and \( \chi_i(x, \lambda_0) \) are linearly independent solutions of (1) on the \( \Omega_i \) \( i = 1, 2, 3 \). Therefore the eigenfunction \( y_0(x, \lambda_0) \) may be represented as
\[ y_0(x, \lambda_0) = \begin{cases} 
\delta_1 \varphi_1(x, \lambda_0) + \gamma_1 \chi_1(x, \lambda_0) & \text{for } x \in \Omega_1 \\
\delta_2 \varphi_2(x, \lambda_0) + \gamma_2 \chi_2(x, \lambda_0) & \text{for } x \in \Omega_2 \\
\delta_3 \varphi_3(x, \lambda_0) + \gamma_3 \chi_3(x, \lambda_0) & \text{for } x \in \Omega_3
\end{cases} \]
where at least one of the coefficients \( \delta_1, \delta_2, \delta_3, \gamma_1, \gamma_2, \gamma_3 \) is not zero. Now applying the boundary and transmission conditions (2)-(7) we obtain
\[ \ell_i y_0(x, \lambda_0) = 0, i = 1, 2, 3, 4, 5, 6 \]
These equalities forms a homogeneous linear system of algebraic equations with respect to the variables \(\delta_1, \delta_2, \delta_3, \gamma_1, \gamma_2, \gamma_3\) whose determinant has the form

\[
\Delta(\lambda) := \begin{vmatrix}
1 & 0 & 0 & 0 & -\varphi_3(\gamma_2) & -\chi_3(\gamma_2) \\
0 & 1 & 0 & 0 & -\varphi'_3(\gamma_2) & -\chi'_3(\gamma_2) \\
\varphi_2(c_1^+) & \chi_2(c_1^+) & -\varphi_2(c_1^+) & -\chi_2(c_1^+) & 0 & 0 \\
\varphi'_2(c_1^+) & \chi'_2(c_1^+) & -\varphi'_2(c_1^+) & -\chi'_2(c_1^+) & 0 & 0 \\
0 & 0 & \varphi_2(c_2^+) & \chi_2(c_2^+) & -\varphi_2(c_2^+) & -\chi_2(c_2^+) \\
0 & 0 & \varphi'_2(c_2^+) & \chi'_2(c_2^+) & -\varphi'_2(c_2^+) & -\chi'_2(c_2^+)
\end{vmatrix}
\]

It is easy to show that

\[
\Delta(\lambda) = W_\lambda(\varphi_2, \chi_2; c_1^+)W_\lambda(\varphi_2, \chi_2; c_2^+)[W_\lambda(\varphi_3, \chi_3; \gamma_2) + 1 - \varphi_3(\gamma_2) - \chi_3'\gamma_2)]
\]

Since the system of algebraic linear equations (37) has nontrivial solution, we have \(\Delta(\lambda_0) = 0\). Now, show that any zero \(\lambda = \lambda_0\) of the function \(\Delta(\lambda)\) is an eigenvalue of the considered problem (1)-(7). Indeed, if \(\Delta(\lambda_0) = 0\), then the system (37) has a nontrivial solution \((\delta_1, \gamma_1, \delta_2, \gamma_2, \delta_3, \gamma_3)\). Therefore the nonrivial function \(y_0(x, \lambda_0)\) defined by (36) satisfies the equation (1) and the boundary and transmission conditions (2)-(7). This means, that \(\lambda_0\) is an eigenvalue.

**Definition 3.4.** The function \(\Delta(\lambda)\) defined by

\[
\Delta(\lambda) = W_\lambda(\varphi_2, \chi_2; c_1^+)W_\lambda(\varphi_2, \chi_2; c_2^+)[W_\lambda(\varphi_3, \chi_3; \gamma_2) + 1 - \varphi_3(\gamma_2) - \chi_3'\gamma_2)]
\]

will be called the transmittal-characteristic function for the boundary value problem (1)-(7).

**Corollary 3.5.** The transmittal-characteristic function \(\Delta(\lambda)\) is an entire function.

4. Conclusion

This work is devoted to the spectral analysis of Sturm-Liouville problems of a new type. In fact, we studied three different Sturm-Liouville equations for three unknown solutions, which are defined on three disjoint subintervals, at the common ends of which four interaction conditions are imposed, the so-called transmission conditions. We first established that the eigenvalues are real and the corresponding eigenfunctions are orthogonal in the appropriate Hilbert space. It is also shown that the considered boundary value problem generates a self-adjoint linear differential operator. Second, using our own approach, we constructed special one-interval solutions, in terms of which a characteristic function of a new type is defined, the so called the transmittal-characteristic function. Finally, we proved that the eigenvalues coincide with the zeros of this characteristic function, which is an entire function. The results obtained are a generalization of the analogous classical results, since in the particular case \(\beta = 1\) our results are equivalent to the analogous results for the classical Sturm-Liouville problems.
