### Abstract

Medicinal plant plays a crucial role in the socio-economic development and maintaining the human health and culture. Naturally, plant-derivative drugs have an imperative position in both traditional and modern medicine. Jharkhand is rich in biodiversity of medicinal plants. The forest area covers about 30.29% of the total area of Jharkhand. The extensive use of such medicinal plants is nowadays being adopted by almost all the developing and developed countries as therapeutic purpose. It is used to heal various diseases and also prevents the ill effects of synthetic drugs. The main objectives of this article are to identify selected native medicinal properties found in the native forest of Jharkhand and maintain the plants under ex-situ conservation Park for socio-economic development of the tribal which has been used for multipurpose curative applications and their value addition for different diseases. In the current article a total of 41 medicinal plants have been selected for study and documented to their therapeutic use against various types of diseases frequently occurred in tribal dominating mining areas at coal capital of the country located at CSIR-CIMFR, Dhanbad in Jharkhand state of India.

**Keywords:** - Ex-Situ conservation, medicinal plants, *Terminalia arjuna*, epilepsy, Therapeutic use, urinary disorders.

### Özet

İlaç yapımında kullanılan bitkiler, sosyo-ekonomik gelişme ve insan sağlığının ve kültürünün iyileştirilmesinde çok önemli bir rol oynamaktadır. Doğal olarak, bitkilerden elde edilen ilaçların kullanılması hem geleneksel hem de modern eczacılıkta kaçınılmazdır. Jharkand, tıbbi ilaç yapımında kullanılan bitkiler bakımından yüksek bir bitki çeşitliliğine sahiptir. Ormanlar, Jharkand'ın toplam alanının %30.29'unu kaplamaktadır. Tedaviye yönelik olarak bu tür bitkilerin ilaç yapımında kullanılması gelişmiş ve gelişmekte olan ülkelerin pek çoğu tarafından benimsenmektedir. Bu bitkilerden yapılan ilaçlar hem çeşitli hastalıkların tedavisinde hem de sentetik ilaçların kullanımından doğan yan etkilerin giderilmesinde kullanılmaktadır. Bu makalenin amacı; Jharkand ormanlarında bulunan ve ilaç yapımında kullanılan önceden belirlenmiş doğal türleri tespit etmek, bu türleri bazı hastalıklara karşı kullanarak değerlendiren aşiretlerin sosyo-ekonomik gelişimine katkıda bulunmak için koruma alanı dışında yetiştirmek ve geliştirmektir. Bu çalışmada, 41 adet doğal tür seçilmiş ve Hindistan'ın Jharkand eyaletine bağlı kömür işletmelerinin en yoğun olduğu Dhanbad şehrinde, bu ilaçları kullanan aşiretler üyelerinin hastalık tedavisinde kullanımlarının dökümü yapılmıştır.

**Anahtar Kelimeler:** Alan-dışı koruma, tıbbi bitkiler, *Terminalia arjuna*, sara, tıbbi kullanım, üriner sistem rahatsızlıkları.

## **Introduction**

Nature has endowed India with rich in medicinal plant resources and its use for medicinal treatments since remote past and the plant-based system continues to be included in a vital responsibility in primary health care of 80% in terms of world's population (Gupta, 2001). About 25% of prescribed drugs in the world are originated from plants (Rates, 2001) and more than 3000 species of plants have been reported to have anticancer properties (Graham et. al.). Shahin, et.al, (2008) has reviewed about 24 plants which have their antioxidant properties and are used as vegetables and could be source of dietary antioxidant supplies, which is another emerging area of research.

Products and related drugs obtained from nature are used to treat almost 87% of all categorized human diseases which includes immunological disorders, bacterial infection, and cancer (Newman and Cragg, 2007). In West African countries still more than 70% of the people use traditional medicine (Pousset, 1994) and about 80% of the populations living in developing nations rely on traditional plant-based medicines for their primary health care needs (FAO, 2004).

Globally in China traditional medicine accounts for around 40% of all health care delivered. About 71% of the population in Chile and 40% in Colombia depend on traditional medicines. In India, 65% of the populations in rural areas use medicinal plants to meet their primary health care needs. In case of developed countries, the percentage of the population that has used such medicines at least once is 48% in Australia, 31% in Belgium, 70% in Canada, 49% in France and 42% in the United States of America (WHO, 2003).

There are over 1.5 million practitioners of traditional medicinal system using medicinal plants in preventive, promotional and curative applications. It is estimated that there are over 7800 medicinal drug-manufacturing units in India, which consume about 2000 tons of herbs annually (Verma and Singh 2008). Indians consume plants based as medicinal plants maximum of 20.0 % which is followed by China (18.9 %), Vietnam (17.1 %), Sri Lanka (16.5 %) and Thailand (15.5 %). While nations such as the USA, Australia, Indonesia and Malaysia have a high number of plant species, but their utilization as medicinal plants are little. Australia has utilized only 7.8 % of its higher plant flora as medicinal plants and this knowledge remains in Aboriginal communities (Gott, 2008).

India has one of the richest plants medical traditions in the world. Numerous of indigenous species all over the world have through their massive connection with nature collected wide knowledge on medicinal plants and their properties, that's why they are used in treatment of various diseases (Grosvenor et al., 1995; Asase et al., 2010; Maroyi, 2011). There are estimated to be around 25,000 effective plant-based formulations, used in folk medicine and known to rural communities in India.

An herbal medicine is only the platform that provides a basis of treatment and cure for a wide range of diseases and physiological conditions in traditional methods practiced such as Ayurveda, Unani, and Siddha. Several authors has reported that numerous plant species are used by many ethnic groups for the treatment of diverse ailments ranging from minor infections to skin diseases, asthma, malaria, dysentery, and a horde of other indications (Dhar et al., 1968; Perumal and Ignacimuthu, 1998, 2000; Dahanukar et al., 2000).

On the other hand India is one among the other major coal producer and ranked fourth in the world and constitutes 493 coal mines, in which Jharkhand state comprised of 140 mines in 2016. The amount of mine spoil generated during coal mining activities is typically > 2 to 3 times that of the coal produced itself. Surface mining produced billion tons of spoil annually (Tripathi et. al 2014). Mining spoils possess very harsh conditions for both plant and microbial growth (Singh et al., 2012). Mining operations result in

severe landscape perturbations that cause major ecosystem damage (Singh et al., 2017) and irreparable impacts to previous soil quality/nutrient cycling capability (Tripathi et al., 2016a). The land use changes drastically change plant species composition and dominant life forms (Tripathi and Singh, 2009, 2012), which in turn affect soils and soil processes (Singh et al., 1991a, Tripathi et al., 2009) and microbial biomass (Singh et al., 1991b, Tripathi and Singh, 2013). Consequently there is great threat of survival of plants due to mining (Tripathi et al., 2016b). The agro-ecology supports production of both agricultural crop, natural medicinal plants and trees (Tripathi et al., 2015). Hence in this paper an attempt has been made to conserve the most frequently used medicinal plant by the local villagers of mining areas and its conservation in ex-situ conservation park at CSIR-CIMFR, Jharkhand, India.

In the world scenario various species of medicinal plants are used by number of countries which has been shown in Table 1.

Table1: Number of Medicinal plant species used by different nations.

S. No.	Country	Medicinal Plants Species	Total No of Species In Flora	% of Flora Used as Medicinal	References
1.	India	7500	17 000	44	Shiva,1996
2.	China	11 146	27 100	41	Pei, 2001
3.	North America	2572	20 000	13	Moerman,1998
4.	Mexico	2237	30 000	7	Toledo,1995
5.	World	52885	297 000–510 000	10–18	Schippmann et al., 2002

## Materials and Methods

### Study area

The *ex-situ* conservation park is located between latitude 23° 48' 57.20'' N and longitude 86 ° 25' 41.71'' E at CSIR-CIMFR, Dhanbad, Jharkhand, India. It is strategically situated in the Damodar basin of eastern part of the country which is endowed with rich coal deposits and hosts several large mineral based industries.

Dhanbad district is called Coal Capital of India due to abundance of coal mines operating and one of the most polluted district with respect to air, water and land pollution resulting in spreading of several diseases. Dhanbad has a population of 2,684,487. Males (1,405,956) constitute 53% of the population and females (1,278,531) 47% (2011 Census Report). It has a sex ratio of 908. Dhanbad has an average literacy rate of 80.78%, higher than the national average of 74.04% male literacy is 87.93% and female literacy is 72.69%.

### Climate

The climate that is dry tropical with a year divisible into three seasons, namely a cold winter (December-February), a very hot summer (April-June) and a rainy season (July-September) (Tripathi et al., 2012). The annual rainfall averages 1,376 mm, 80% of which occurs between late June and September. The mean daily temperature within the annual cycle ranges from 10 to 28°C, while the mean daily maximum ranges from 26-45°C (Singh et al., 1996a). The soil surface layer is 100-110 mm thick consisting of grey brown to very pale brown sandy loam, and clay loam with sub-angular blocky structure. The bedrock is formed of medium to coarse grained sandstone, clay with ferruginous bands and carbonaceous shales.

## Vegetation

The native typical mixed dry deciduous forest is dominated by tree species Palash (*Butea monosperma* (Lamb.) Taub), Asan (*Terminalia tomentosa* Wight & Arn.) Sal (*Shorea robusta* Gaertn.) and Shishum (*Dalbergia sisoo* Rujuta). The species such as Sidha (*Lagerstromia parviflora* Roxb.), Gamhar (*Gmelina arborea* Roxb. ex Sm), Siris (*Albizia lebbek* L.Benth), Bahera (*Terminalia belerica* (Gaertn.) Roxb.), Bel (*Aegle marvelous* L. Correa) etc. Semal (*Bombax malabaricum* DC), Khair (*Acacia catechu* (L.f.) wild), Mahua (*Madhuca indica* G.F. Gmel), are found scattered in the forests. Salai (*Boswellia serrata* Roxb. ex Colebr) one of the common species in dry mixed deciduous forests in other parts of Jharkhand is almost absent here except a few poor specimens in Tundi Pahar. Good quality of bamboo forests are found mixed with the miscellaneous forests.

Snakes of the poisonous varieties such as cobra and karait are fairly common and most frequently even Dhaman snake can be seen. In the hilly areas an occasional python is met and various species of harmless grass snakes are generally common in Dhanbad district.

The study was carried through out in planted in the year 2001 at ex-situ conservation Park. The planted specimens were photographed as well as collected, pressed and dried in the field. The species were identified by the Botanical Survey of India, Kolkata The local names of the plants were obtained from the local habitant and documentation. The socio-interaction was carried out to know its therapeutic uses form vaidyas and door to door survey was done. On the basis of this the various therapeutic uses of selected medicinal plants has been identified.

## Results

During the entire study period it was observed that a single plant has been used in curing of various disorders. The list of medicinal plants uses and disorders was compiled and the number of plants used against each category was estimated. The frequency of a single plant used for curing different number of diseases was also calculated as shown in the Table 2.

Table 2: List of Identified Medicinal Plants under Ex-Situ Conservation Park

S.no	Local name	Botanical Name	Parts used	Medicinal use
1.	Ajwain	<i>Carum copticum</i> (L.) C.B.Cl,	Leaves and Seeds	Reduces flatulence caused by beans when it is cooked with beans. Seeds used as a substitute for cumin as well. It is known for supporting the digestion.
2.	Akwan	<i>Calotropis procera</i> (Aiton) W.T. Aiton	Roots, stem bark, latex, leaves and flowers	Used in cataract, tooth ache, face marks hair lice and itching of head. It is used in treatment of epilepsy, migraine, jaundice, dyspepsia, urinal problems, eczema, wounds, leprosy and scabies.
3.	Arjun	<i>Terminalia arjuna</i> (Roxb.) Wight & Arn.	Leaves, stem and bark	Used in menstrual discomfort, as a cardiogenic, injury, blood disorders, obesity, urinary disorders and ulcer or wound. Bark powder used as astringent and diuretic properties.
4.	Aswgandha	<i>Withania somnifera</i> (L.) Dunal	Seeds, Stems, Leaves, Flowers and roots	Used as an adaptogen, diuretic, sedative, increases male and female fertility along with inflammatory conditions.
5.	Bahera	<i>Terminalia bellerica</i>	Fruits,	Used in making hair-oils ailments. It is also the

		(Gaertn.) Roxb.	Kernel, Bark	most important constituent of Ayurvedic Triphala. Fruit chewed is believed to cure cough, cold, asthma and hoarse voice.
6.	Bel	<i>Aegle marmelos</i> (L.) Correa	Leaf, bark and fruit	Dysentery, stomachache, fistula, piles, hemorrhoids, leucorrhoea, mouth ulcers, swelling pimples and nose bleeding.
7.	Ber	<i>Ziziphus jujuba</i> (Miller)	Fruit pulp seed, leaves, Bark and flowers.	In diarrhea, dysentery, ulcers, eye infections, vomiting, coughing, and asthma and antifungal effective in poultry suffering from diarrhoea and to humans for indigestion.
8.	Paan	<i>Piper betle</i> (L.)	Leaves.	Throat, infection, diphtheria, lymphadenopathy, back pain, impotency, erectile dysfunction, indigestion and constipation.
9.	Brahmi	<i>Bacopa monnieri</i> (L.) Pennell	Whole herb	Antioxidant properties. Used as brain tonic, memory enhancer and facilitates learning and used for curing epilepsy and inflammations.
10.	Cactus	<i>Opuntia ficus-indica</i> (L.) Mill	Fruit and seeds.	Use as anti-diabetic, anti-inflammatory, analgesic, hypoglycemic, antiviral and anti-oxidant. Preparations have been used to regulate weight, blood sugar, increase fiber intake and facilitate childbirth and are used in the treatment of asthma, fatigue, liver injury.
11.	Chandan	<i>Santalum album</i> L.	Wood, oil.	Chronic bronchitis, gonorrhoea and strongly aromatic used in perfume.
12.	Chitrak	<i>Plumbago zeylanica</i> L.	Root, root bark and seeds	Inflammation, bronchitis, itching used in rheumatism and ringworm. Roots used in improving digestion.
13.	Dhatura	<i>Datura stramonium</i> L.	Leaves and seeds	Anti-asthmatic agent, asthma, gastric pains and indigestion. It is used in burns, ulcers, sinus infection, headaches, and sores.
14.	Giloe	<i>Tinospora cordifolia</i> (Willd.) Miers	Leaves and stem	Used in rheumatism, gout, dyspepsia, urinary, diseases, liver tonic. Its watery extract is known as Indian quinine.
15.	Gular	<i>Ficus racemosa</i> L.	Fruits and leaves	Anti-diarrhoeal, antidiuretic, antitussive, anti-pyretic and hypoglycemic activities.
16.	Gritkumari	<i>Aloe vera</i> (L.) Burm.f.	leaves	Laxative, wound healing, skin burns and care. In ulcer, hydrophobia, dysentery, diabetes and piles.
17.	Imli	<i>Tamarindus indica</i> L.	Fruits, Seeds, Leaves and Flowers	Used as digestive, carminative, laxative, expectorant antioxidant, anti-inflammatory, antimicrobial, anti-fungal and anti-viral activity.
18.	Jamun	<i>Syzygium cumini</i> (L.) Skeels	Leaf, Bark, Seed and Pulp	In diabetes, anti-allergic, antioxidant, anti-viral, anti-bacterial, anti cancer, anti inflammation and in gastric ulcer.
19.	Kachnar	<i>Bauhinia variegata</i> L.	flower bark flower root and	In diarrhea, dysentery, malaria, bleeding piles, snakebite, ulcers, tumours, obesity, indigestion, tuberculosis and leprosy.
20.	Kalmegh	<i>Andrographis paniculata</i> (Burm.fil.) Nees	Whole Plant	Immunosuppressive, blood purifier, anthelmintic, astringent. It is used in fever, jaundice, cholera, malaria, anemia, loss of appetite and dysentery.
21.	Karanj	<i>Pongamia pinnata</i> (L.) Pierre	Fruits, bark, leaf, dried roots, seed oil, and flower.	Oil with citrus lemon fruit juice used in eczema, ring-worm and scabies.

22.	Kathal (Jackfruit)	<i>Artocarpus heterophyllus</i> Lam.	seeds fruit leaves	Fever, aging, antipyretic anti-asthmatic, and anticancer.
23.	Lemon Grass	<i>Cymbopogon citratus</i> (DC.) Stapf	Aerial parts	Beneficial in cough and cold, lemon oil is used as aromatic oil and as insect repellent.
24.	Mandukaparni	<i>Centella asiatica</i> (L.) Urb.	Whole plant	Antibacterial, anti-inflammatory, in treatment of leprosy and epilepsy. Used for enhancing the receptive capacity of mind in improving the power of speech and poetic imagination.
25.	Mehendi	<i>Lawsonia inermis</i> L.(henna)	Leaves, bark and seeds	Headache, itching and burning sensation, mental disorder. Used for cosmetic purposes.
26.	Musli	<i>Chlorophytum borivillianum</i> Santapau & R.R.Fern.	Tuberous roots or rhizome	Effective in gonorrhoea addition with menorrhagia, leucorrhoea, piles and leucoderma. Sexual power enhancers, dyspepsia aphrodisiac and anti-pyretic properties, vaginal dryness and infertility.
27.	Nagphani	<i>Opuntia dillenii</i> (Ker Gawl.) Haw.	Whole plant	Used in treatment of inflammation, constipation and pneumonia.
28.	Neem	<i>Azadirachta indica</i> A.Juss.	Rhizome leaves and barks	Sedatives, analgesic, epilepsy and hypersensitive.
29.	Palas	<i>Butea monosperma</i> (Lam.) Taub.	Seeds, gum, leaves, flower and bark	Used as purgative, diuretic anthelmintic, anti-parasitic used against intestinal parasites and in Haemorrhage.
30.	Pather Chutt	<i>Bryophyllum calycinum</i> Salisb.	Leaf	Leaves prevent ulcer and treat acute inflammation. It is rich in alkaloids, triterpenes, glycosides, flavonoids, steroids and lipids.
31.	Papita	<i>Carica papaya</i> L.	Fruits, pulp, seeds and roots	The juice for warts, corns, cancers of the uterus, tumors, and thickened skin, syphilis, the tropical infection, hemorrhoids, and to remove mineral concretions in the urine; diuretic, to stimulate lactation, labor, or abortion. Ripen fruit used as rheumatism and alkalizing the urine. Leaves applied externally as an antiseptic or to heal burns or scalds, or to the cervix to contract the uterus.
32.	Sissoo	<i>Dalbergia sisoo</i> DC.	Roots, seeds and wood	Oil obtained from the seeds is used to cure skin diseases and leprosy.
33.	Satavar	<i>Asparagus racemosus</i> Willd	Roots	Improves physical stamina and increases body immunity.
34.	Sarpagandha	<i>Rauwolfia serpentina</i> (L.) Benth.ex Kurz	Leaves, Fruits and roots	High blood pressure, mental disorders, insomnia, snake bites and hypertension.
35.	Satwan (Chatim)	<i>Alstonia scholaris</i> (L.) R. Br.	Leaves and bark	Bark decoction in diarrhea and dysentery, milky sap in skin disease.
36.	Tulsi	<i>Ocimum sanctum</i> Var.angustifolium Benth.	Leaves	In cold, cough & dysentery. It is likely to prove prophylactic against negative effects of environmental toxins and antibacterial properties.
37.	Sirish	<i>Albizia lebeck</i> (L.) Benth.	Seeds, leaves and roots	Fungicidal, anti-carcinogenic, immune modulation activities and regulation of cell proliferation. Cholesterol lowering capacity.
38.	Sitafal	<i>Annona squamosa</i> L.	fruits Roots Leaves seeds and Bark	In parasitic infections, spinal diseases, a powerful astringent. In Ayurveda used as a good tonic; enriches blood, as expectorant, increases muscular strength, burning sensation, vomiting and destroy

39.	Raimuniya	<i>Lantana camara</i> Var. <i>aculeate</i> (L.) Moldenke.	Whole plant, leaves and roots	lice in hair. Seeds are powerful irritant of conjunctiva. In Fever, cold and cough, rheumatism, asthma high blood pressure. Plants are given in the treatment against tetanus, malaria and as a lotion for ulcers and swellings.
40.	Doob	<i>Cynodon dactylon</i> (L.) Pers.	Rhizome and leaves	In diabetes control, wounds, dropsy, secondary syphilis, diuretic, anti-emetic, dysentery and as antioxidant.
41.	Drumstick (Sahijan)	<i>Moringa oleifera</i> Lam.	Leaves, seeds and bark	Used as a purgative, antipyretic, and anti-inflammatory agent. Leaf juice or bark paste is used as a drink for constipation and piles.

## Discussion

In the term of the richness in traditional knowledge systems related to the use of plant species, India is one of the leading countries in Asia. India is also known for its wealthy diversity of higher plant species (about 17000 species) of which 7500 are known as medicinal plants having its aesthetic value (Shiva, 1996). Our study based on socio-economic survey of village following plants were conserved for day to day use. The result of this study has been described in Table 2. The described plants has widely distributed in Jharkhand state whose pharmaceutical values are not well documented to be used by the local people.

### 1. Ajwain (*Carum copticum*)

In the Unani medicinal system basically ajwain is used for enhancing body's resistance (Dymock, 1893) and it is also effective in stomach disorders, amoebiasis and febrile conditions (Basu, 1933). Maryam et. al, 2010 have studied and evaluated the antioxidant and antimutagenic properties from the fruit extract of *C. copticum*. An experimental study reveals that oil of *C. copticum* is extremely effective against *Sitophilus oryzae* (L.) and *Tribolium castaneum* (Herbst) beetles and offer a strong insecticidal fumigant for stored product insects (Bibi, 2007).

### 2. Akwan (*Calotropis procera*)

In India, traditionally the secretion of *C. procera* root bark is used in the treatment of skin diseases, enlargements of abdominal viscera and intestinal worms (Parrotta, 2001). Similarly (Kew, 1985) has studied from the milky latex *C. procera* is useful in the treatment of cutaneous diseases such as ringworm, syphilitic sores and leprosy in Senegal.

### 3. Arjun (*Terminalia arjuna* (Roxb.))

*Terminalia arjuna* (Roxb.) is used in the treatment of diverse human diseases such as blood diseases, anemia, venereal and viral disease and to continue excellent healthiness. Beside this it has been also used in the treatment of ulcers, fractures, hepatic and perform, excellent properties of hypocholesterolemic, antibacterial, antimicrobial, anti-tumoral, antioxidant, anti-allergic and antifeedant, anti-fertility and anti-HIV activities (Ram et.al., 1997; Bachaya et.al., 2009; and Phani et.al., 2013).

### 4. Aswagandha (*Withania somnifera*)

A pilot study have carried out during his clinical investigation they observed that root extract of *Withania somnifera* performs better in improving sexual function in women (Swati, et al., 2015). A study by Erlandsen et al (2012) focused on the adjuvant therapy against tumor cells, and effects on hypersensitivity and inappropriate immune balance of the *Withania somnifera*.

5. Bahera (*Terminalia bellerica*)

A number of authors have reported *T. bellerica* fruits are used in traditional medicine and documented biological activities such as antimicrobial, antidiabetic, anti-oxidant anti-HIV and anti-proliferative against cancer cell activities (Elizabeth 2005; Sabu 2009; Kaur 2005 and Valsaraj 1997).

6. Bel (*Aegle marmelos*)

A study revealed that leaf extracts of *Aegle marmelos* and its fractions have found fungicidal activity against various clinical isolates of dermatophytic fungi and it drastically inhibits their growth (Balakumar et al 2011).

7. Ber (*Ziziphus jujuba*)

According to Bown 1995; Duke and Ayensu 1985; Him-Che 1985, the dried fruits of *Zyzyphus Jujube* posses various properties such as an anodyne, anticancer, pectoral, refrigerant, sedative, stomachic, styptic and tonic and immune response enhancer.

8. Pan (*Piper Betle*)

The betel leaves (*Piper Betle*) are used in a household remedy for the treatment of inflammation in the oral cavity (Satyavati et al 1987). Similarly various authors have also reported for anti-mutagenic, anti-carcinogenic, antiplaque, anti-diabetic, anti-inflammatory and antibacterial bioactivities (Amonkar et al., 1986; Padma et al., 1989; Arambewela et al., 2005; Mazura et al., 2007; Nalina and Rahim 2007; Hajare et al., 2011).

9. Brahmi (*Bacopa monniera*)

A study reveals that, the alcoholic extract of *Bacopa monniera* has provided the ability, consolidation and retention of memory in albino rats and noticed its effect on 3 newly acquired behavioural responses, viz. active conditioned avoidance, Sidman continuous avoidance responses and foot shock motivated brightness discrimination (Singh and Dhawan,1997).

10. Cactus (*Opuntia ficus-indica*)

Various authors have reported from different evidence obtained through an experimental study and it suggested that cactus pear decline cholesterol levels in human blood and also alter low density lipoprotein (LDL) composition (Stintzing and Carle 2005; Stintzing et al., 2001; Gurbachan and Felker 1998; Fernandez et al., 1992 and Frati 1992). In Mexico stems of prickly pear cactus have been traditionally used to treat diabetes (Zou et al. 2005). Several authors have reported from experimental evidences that reduction in cholesterol levels and modification in LDL composition in human blood was found through cactus pear (Ennouri et al. 2006; Frati 992; Gurbachan and Felker 1998).

11. Chandan (*Santalum album*)

Chandan has been considered one of the most holy plant in India and often used to cool the body. George and Ioana 2008 has tested sandalwood oil and found that during *Rec* assay it showed the properties of anticarcinogenic, antiviral and bactericidal activity.

12. Chitrak (*Plumbago zeylanica*).

*Plumbago zeylanica* Linn. is useful in the treatment of impotency (Gogte 2009), leprosy (Kirtikar and Basur 2001), jaundice, migraine, urinary calculi, internal abscesses, insanity, seminal weakness, vaginal discharge (Dev 2006) colic, cough, asthma, helminthiasis, elephantiasis, hepatosplenomagaly, epilepsy, hysteria, nervous and rheumatic affections, obesity, indolent ulcer (Chatterjee and Chandra 2003).

13. Dhatura (*Datura stramonium*)

In the past *D. stramonium* has been used traditionally as an antiasthmatic, an anesthetic, an ointment for burns or rheumatism, and as a psychoactive drug (Hightower 1979). It is used in the treatment of asthma, burns, ulcers, sinus infection, headaches, sores (Mitchell and Ahmad, 2006). It has been observed as a source of alkaloids production and used in both human and veterinary medicine (Kingsbury 1964). It has been also reported for its various pharmacological properties such as an anaesthetic for setting bones, whooping cough, muscle spasm, sciatica, in painful menstruation, treating bruises and wounds, skin ulcers, hemorrhoids, asthma, and for rheumatism. (Satyavati et al., 1976).

14. Giloe (*Tinospora cordifolia*)

The whole, aqueous, standardized extracts of *Tinospora cordifolia* is used for diabetes, liver tonic and *Asparagus racemosus* were found to be effective in increasing body immunity and provides protection against a range of biological, physical and chemical stressors (Rege et.al, 1999). It has been also reported that dry barks of *T. cordifolia* posses various pharmacological properties such as has anti-inflammatory (Rai and Gupta, 1966; Pendse et al., 1977), anti-allergic (Nayampalli, 1986), anti-spasmodic, antipyretic (Ikram et al., 1987) and anti-leprotic (Asthana et al., 2001).

15. Gular (*Ficus glomerata*)

The evidence based on the result and it reveals that ethanol extract of *F. glomerata* acts as a powerful antioxidant and a possible radioprotector (Veerapur et.al, 2009). Similarly several co-authors have also reported that the stem bark of *F. racemosa* is robustly effective in anti-diarrhoeal, antidiuretic, antitussive, anti-pyretic and hypoglycemic activities (Mukherjee et.al, 1998; Ratnasooriya et.al, 2003; Bhaskara et.al, 2003; Rao et.al, 2002; and Bhaskara et.al, 2002).

16. Gritkumari (*Aloe vera*)

It has been reported that *A. vera* various pharmacological properties and used in anti-inflammatory, antiarthritis, antibacterial, antifungal, and hypoglycemic effects (Rosca-Casian et al., 2007). Additionally it is also very supportive in controlling against alopecia disease as fungal infections. Similarly Fujita et al (1976) have also reported the anti-microbial and anti-fungal properties of *A. Vera*. According to Cera et al (1980) the gel of *A.Vera* is very useful in burning and effective against *Pseudomonas seruginosa*.

17. Imli (*Tamarindus indica*)

Several researchers have reported the Pharmacological properties of *T. indica* their extracts possess antibacterial, antifungal (Pousset, 1989) properties and also used for cytotoxic (Kobayashi et al., 1996) and gastrointestinal (Coutino-Rodriguez et al., 2001). A 2015 study carried out by Sundaram, m. s. et al demonstrated the anti-arthritic efficiency of tamarind seed extract (TSE). TSE exhibited cartilage and bone protecting nature by inhibiting the elevated activities of MMPs, HAase, exoglycosidases, cathepsins and TRAP. A study reveals that the methanolic leaf extract of *T. indica* shows antibacterial activity against *Burkholderia pseudomallei* (Muthu et al., 2005). Similar studied was also carried out in which *T.*

*indica* have showed imperative antimicrobial activity against *Klebsiella pneumonia* from methanol and acetone extracts. The antibacterial activity was done by agar disk diffusion method and the activity was compared with standard antimicrobials *Amikacin* and *Piperacillin* (Vaghasiya and Chanda 2009).

18. Jamun (*Schizygium cumini*)

It has been reported world widely that the fruit of *Syzygium cumini* is used for curing various ailments such as cough, diabetes, dysentery, inflammation and ringworm (Reynertson et al, 2005). *S. cumini* is also used by traditional people in the treatment of diabetes, stomachic, and bronchitis (Ruan et al, 2008; Jain et al, 2010).

19. Kachnar (*Bauhinia variegata*)

In India, *B. variegata* has been broadly used as a medicinal plant in Ayurveda, Unani, Homeopathy and by the ethnic systems of medicines. It is whispered to use as anti-tumour, anti-microbial, anti-inflammatory, anti-goitrogenic, hepatoprotective and haemagglutination properties (Mali et al., 2007). The roots of *Bauhinia variegata* are used as antidote in snake poison (Reddy and Yadava, 2003).

20. Kalmegh (*Andrographis paniculata*)

Several authors have found the ethnopharmacological properties of *A. paniculata* during in vitro and in vivo studies and illustrate for anti-hepatotoxic, anti-urothelial antihepatotoxic and anti-cold (Caceres et al., 1997; Kapil et al., 1993; Sheeja and Kuttan 2006). In several studies it has also been reported its anti-malarial properties (Najib et.al.1999; Siti et.al., 2002; Dua et.al., 2004; Misra et.al., 1992).

21. Karanj (*Pongamia pinnata*)

During an experimental study the extract derived from the seeds and roots of *Pongamia pinnata* has reduced pentobarbitone sleeping time, possibly by stimulation of the hepatic microsomal enzyme system (Singh et.al, 1996b). Furthermore from the petroleum ether extract (PEE) of the roots improved pentobarbitone sleeping time, probably due to CNS depression when it was experimented on albino rats (Singh et.al, 1997).

22. Kathal (*Artocarpus heterophyllus*)

In South- East Asia *Artocarpus* is used traditionally in the treatment of ulcers, abscess, and diarrhea. It is also used to treat inflammation and malarial fever (Heyne, 1987; Perry, 1980). According to ICUC, 2003 report the extract is used to reduce fever and diarrhea. The roots are also used against skin diseases and asthma (ICUC, 2003).

23. Lemon grass (*Cymbopogon citratus*)

*Cymbopogon citratus* is used as a sedative in Mexico (Tortoriello and Romero, 1992). The leaves are also consumed as a sedative and analgesic purpose in Brazil (Hiruma- Lima et al., 2002) and Carlini et al. (1986) have found that *C. citratus* is widely used traditionally as medicine for treating nervous disturbances. Similarly the tea prepared from leaves is broadly used as an antiseptic, antifever, antidyspeptic, carminative, tranquilizer and stomachic agent (Barbosa et al., 2008). Several studies reveal that it is also used as anti-inflammatory, antiseptic, diuretic, neurobehavioral, antimicrobial, and fungistatic (Carbajal et al., 1989; Francisco et al., 2011).

24. Mandukpurni (*Centella asiatica*)

A small herb *Centella asiatica* is traditionally used in treating skin diseases and leprosy (Chopra et al., 1956) at the same time as it is also showing the wound healing activity (Rosen et al. (1967) and antiulcer activity (Yoshinori et al., 1982). The whole plant of *C. asiatica* is very helpful in improving brain memory (Mukerji, 1953; Vaidyaratnam, 1994).

25. Mehendi (*Lawsonia inermis*)

The study was carried out on memory and behaviour mediated from petroleum ether extract of *Lawsonia inermis* leaves showed that significant nootropic effect on the elevated plus maze and passive shock avoidance paradigms. The extract also enhanced clonidine induced hypothermia and decreased lithium induced head twitches. Thus it reveals that affects 5HT and noradrenaline mediated behavior and had no effect on haloperidol induced catalepsy, consequently showing no effect on dopamine mediated behavior (Iyer et.al, 1998).

26. Musli (*Chlorophytum borivilianum*)

The authors investigated pharmacological properties of *Chlorophytum borivilianum* as carminative, anti-pyretic, diuretic and astringent effects (Kirtikar and Basu, 1975). In addition *Chlorophytum borivilianum* have also reported for its variety of pharmacological properties such as analgesic (Panda et al., 2007), anti-inflammatory (Panda et al., 2011a), antipyretic (Panda et al., 2011b), hepato protective (Sharma and Kumar, 2011), antimicrobial (Sriram et al., 2012), antioxidant (Kaur et al., 2010), hypolipidemic (Visavadiya and Narasimhacharya, 2011) and antidiabetic (Mujeeb et al., 2009).

27. Nagphani (*Opuntia dillenii*)

The cladodes of *O. dillenii* have been observed for various properties such as antiviral (Ahmad, et al., 1996), antigenotoxic (Zorgui, et al., 2009), anti-inflammatory and wound-healing (Galati et al., 2003). Similarly Loro and Pérez-Santana (1999) have evaluated the analgesic and anti-inflammatory actions of the genus *Opuntia* from the fruit extract of *Opuntia dillenii*.

28. Neem (*Azadirachta indica*)

It has been observed that leaves, seeds, roots, bark and the flowers of *Azadirachta indica* are used for several ailments such as jaundice, stomach ulcers, leprosy, malaria and chicken pox (NRC 2011). Oil from leaves and bark inhibits the growth of pathogenic bacteria especially *Mycobacterium* and *Streptococcus* (Biswas et al., 2002).

29. Palas (*Butea monosperma*)

*Butea monosperma* is usually used in constipation, piles, diabetes, worms, and congested throat (Kapoor 1990). The plant *B. monosperma* possess a numeral pharmacological properties such as antifungal (Yadava and Tiwari, 2007), antimicrobial (Gurav et al., 2008), antidiabetic (Somani et al., 2006), antihelminthic (Iqbal et al., 2006), anti-inflammatory (Shahavi and Desai, 2008) and antidiarrheal (Gunakkunru et al., 2005). Several researchers have also reported the various therapeutic uses of *B. monosperma* as anti-inflammatory, antioxidative, chemopreventive and hepatoprotective (Sehrawat and Sultana, 2006).

30. Pather chutt (*Bryophyllum pinnatum*)

Recently from in vitro study it was confirmed that *B. pinnatum* inhibits human myometrial contractility it decreases the amplitude of spontaneous contraction while decreasing both the amplitude and frequency of induced contraction (Gwehenberger et al., 2004). A number of pharmacological properties of *B. pinnatum* were observed and used as analgesic in blennorrhoea, syphilis, jaundice, candidiasis, dysmenorrhoea, external ulcers, burns and convulsions. *B. pinnatum* is also used to treat ear infections, cough and dysentery (Akinpelu, 2000).

31. Papita (*Carica papaya*)

An aqueous and ethanol extracts of *Carica papaya* has predominately effective in hepatoprotection against carbon tetrachloride induced hepatotoxicity when it was evaluated in rats (Md and Zinnat 2010). According to FAO, (1996) report medicinal plants such as *Carica papaya*, used in hypertension used in Nigeria.

32. Sisoo (*Delbergia sissoo*)

Several authors have reported that an extract particularly from aerial parts of *D. sissoo* is used significantly for antipyretic, analgesic, and estrogen-like activities (Sarg et al., 1999). It has also reported its pharmacological properties in stimulation of new cell growth and tissue regeneration (Hajare et al., 2001). Leaf Juice of *D. sissoo* is very effective in gonorrhoea (Rahman et al., 2008).

33. Satavar (*Asparagus racemosus*)

Basically *Asparagus racemosus* is used by traditionally for various medicinal properties such as emollient, cooling, nerve tonic, constipating, galactogogue, aphrodisiac, diuretic, rejuvenating, carminative, immunostimulant, gastroprotective and antiseptic effects (Patel and Patel, 2013; Ravishankar et al., 2012; Battu and Kumar, 2010). Several authors has also reported on different pharmacological properties like memory enhancing activity (Ojha et al., 2010), phytoestrogen effects (Sharma et al., 1996), adaptogenic effect (Rege et al., 1999), immunomodulatory effects (Diwanay et al., 2004), antidepressant (Singh et al., 2009; Meena et al. 2011).

34. Sarpargandha (*Roulfia serpentina*)

In India *Rauwolfia serpentine* is an important medicinal plant. It has been broadly used for centuries in treatment of hypertension, insomnia, anxiety and other disorders of central epilepsy (Ghani, 1998). It has been also reported that it works effectively in mental disease, epilepsy, sleeplessness and numerous other ailments (Ojha and Mishra, 1985). In India and Malaya-peninsula, the root of this plant has been popular from ancient times and used as an antidote especially to insects and poisonous snakes. It is also used as febrifuge and stimulant to uterine contraction for insomnia and mainly for mental illness (Vakil, 1949).

35 Satwan (*Alstonia scholaris*)

Several researchers have reported that *A. scholaris* possess neuro-pharmacological (Bhattacharya et al., 1979), anticancer (Jagetia and Baliga, 2006), bronchodilatory (Channa et al., 2005), antifertility (Gupta et al., 2005). Khan (2003) reported that the crude methanolic extracts of the leaves, stem and root barks of *A. scholaris* along with *L. tetramera* have broader spectrum of antibacterial activities. Deena and Thoppil (2000) confirmed that some essential oil of *L. camara* is very effective against antibacterial and antifungal activities.

36. Tulsi (*Ocimum sanctum*)

Various researchers have studied the efficiency of *Ocimum sanctum* essential oil (EO) and its major component, eugenol against the fungi causing biodeterioration of food stuffs during storage. They illustrated that extract obtained from *O. sanctum* plant in the form EO and eugenol can be a safe preservative against fungal infections (Ashok et al., 2010). In India traditionally use of *Ocimum sanctum* has recognized for numeral properties such as rejuvenating, tonic, and vitalizing properties that enhances their longevity and a healthy life, and also used for antiseptic, antiallergic, and anticancer (Reen et al., 1996; Samuelsson 1999). According to FAO,(1996) report *Ocimum basilicum* is used to cure for typhoid fever in Nigeria.

37. Sirish (*Albizia lebbek*)

Several authors have reported the medicinal importance of *A. lebbek* to treat snake bites. It is effective in eye-troubles, used as astringent, expectorant and anthelmintic and also effective in piles and diarrhoea. Root bark is used for strengthening gums in the form of dental powder (Ch et al., 2006; Sastry and Kavathekar, 1990). A studied has found noticeable inhibitory effect on paw edema shows that *A. lebbek* possesses a remarkable anti-inflammatory activity to treat various inflammatory diseases (Prakash et. al, 2009). It also provides carbon sequestration benefit (Tripathi et al., 2015).

38. Sitafal (*Annona squamosa*)

During an experimental studied it has been found the potential of nanocrystalline palladium nanoparticles production using acaricidal, insecticidal and larvicidal value of *A. squamosa* an aqueous peel extract as the biomaterial for the first time. Their results open the possibility of green pathways to produce palladium nanoparticles. *A. squamosa* is broadly used as traditional medicine in different cultures. It is used in the treatment of epilepsy, dysentery, cardiac problem, worm infection, constipation, hemorrhage, antibacterial infection, dysuria, fever, and ulcer. It also possesses the properties such as antifertility, antitumor and abortifacient (Selvaraj et. al., 2012).

39. Raimuniya/Putus (*Lantana camara*)

The study carried by Barreto et. al., (2010) and they found that ethanolic extracts of *L. camara* leaves and roots exhibited for antimicrobial activity against *Staphylococcus aureus*, *Proteus vulgaris*, *Pseudomonas aeruginosa*, *Vibrio cholerae*, *Escherichia coli* and two multi-resistant strains *E. coli* and *S. aureus*.

40. Doob (*Cynodon dactylon*)

In India *C. dactylon* are usually used in controlling diabetes. Several researchers have also reported the various therapeutic uses of *C. dactylon* for diabetes (Kirtikar and Basu, 1996), diuretic, anti-emetic, purifying agent, in dysentery, as antioxidant and incredibly effective in hypolipidemic (Ahmed et al., 1994; Shivalinge et al., 2009; Sadki et al., 2010; Saroja and Annapoorani 2012; Karthik Ravisankar, 2011; and Rai et al., 2011).

41. Drumstick (*Moringa oleifera*)

It is reported that the seeds of *Moringa oleifera* is used as a purgative, antipyretic, and anti-inflammatory agent (Varier 1997). *M. oleifera* works as an antioxidant in the presence of high amounts of polyphenols (Fahey, 2005). Several authors have also reported that it is widely used by patients affected from diabetes, hypertension, or HIV/AIDS (Dieye et al., 2008; Kasolo et al., 2010; Monera and Maponga, 2010). In many regions of African country an anti-microbial activity was also found against many

pathogenic bacteria such as *Staphylococcus aureus*, *Bacillus subtilis*, *Escherichia coli*, and *Pseudomonas aeruginosa* in dose dependent manner (Saadabi and Abu Zaid, 2011). A clinical study reports that the leaves of *M. oleifera* considerably decrease blood glucose level in Wistar rats and Goto-Kakizaki (GK) rats, modeled type 2 diabetes (Ndong et al., 2007). Similar study also revealed that the extract of *M. oleifera* leaf is efficient in lowering blood sugar levels within 3 h after ingestion (Mittal et al., 2007).

According to Farnsworth, et al. (1985) World Health Organization (WHO) has estimated about 4000 million people of the world is dependent on traditional medicine. Additionally medicinal plants are also rich in biologically active compounds and play a vital role in drug discovery. Solanki, (2010), Wandre (2013), Patwardhan et al., (2010) and Shah et al., (2011) reported that the extracts of medicinal plants are used in the treatment of various health problems against bacterial infections, ulcers, arthritis, inflammatory respectively. It has become possible from drugs discovery that medicinal plants have also led to the isolation of cocaine, codeine, digitoxin, and quinine including to morphine drugs and still they are in use (Newman et al., 2000; Butler, 2004; Samuelsson, 2004). An experimental study reveals that ethanolic extracts of aerial parts of *Cynodon dactylon* (L.) Pers contain anti-diabetic and anti-diarrhoeal properties (Md et al., 2015).

### Conclusion

In terms of importance of such medicinal plants opens the door for researchers in the various fields of pharmacy. More researches are needed to identify the active compound and this will be helpful in determining in proper utilization for personal and for industrial needs. Medicinal plants play an important role in providing knowledge to the researchers in the field of ethno-botany and ethno-pharmacology, so this article will attract the attention of ethno-botanists, phyto-chemists and pharmacologists for further critical investigation of medicinal plants present in Ex-Situ Conservation Park in CSIR-CIMFR, Dhanbad (Jharkhand), India. It has concluded that the above findings of medicinal plants, herbs, and shrubs are the source of diversified flora. Some of the plants were found to have two-fold uses. Further extensive ethnobotanical and ethnopharmacological study may lead to the discovery of bioactive compounds and alkaloids for different diseases. In addition they must be conserved at any cost. Conservation of medicinal plants can be done by extending cultivation of precious and valuable species on the basis of sustainable utilization of biodiversity and carbon sequestration benefits. More emphasis should be given for the implementation in conservation of such valuable medicinal plants.

### Acknowledgements

The authors are grateful to the Director, CSIR-CIMFR Jharkhand, India for their kind permission for publication this article. Authors are also thankful to all staff members of ex situ conservation of Botanical Park without their support and encouragement this work would not have been possible.
