**Abstract** – The article considers the photochemical dissociation of the phenol solution in the presence of TiO$_2$ nanoparticles, which synthesized in moderate conditions and dimensions vary between 10-30 nm and the 100mg/ml NH$_3$ solution. The appearance of photochemical dissociation was confirmed on the basis of the absorption curves taken before and after the process and Abs curves were drawn on the “Varian” device. Phenol's photochemical dissociation in UV-visible area has been confirmed by experiments.

**Keywords** – NH$_3$solution, degradation, phenol, nanoparticles, etc.

---

**I. INTRODUCTION**

We know that wastewater treatment is currently one of the environmental problems in the world. Pollution of water basins through toxic organic substances are considered to be one of the global environmental issues and therefore implementation of new methods are needed for the solution. Nowadays, heterogeneous photo catalytic techniques are considered as the most effective methods for environmental protection and purifying wastewater from phenol compounds. On the other hand, the processes involved in nanoparticles regarding to the development of nanotechnology are very interesting and new. In the viewed case, waste materials are taken in very small quantities, so this is considered to be ecologically positive. In this regard, effective purifying methods by using nanoparticles are now widely used [1-3]. Phenol is always found in wastewater as it comes from petrochemicals, medicines, plastic, coal, paint and paper industry. Generally, phenol is one of the most important hazardous pollutants due to poor biological degradation, high concentrations, and high toxicity in terms of long-term adverse environmental effects [4]. The gradual decline of freshwater and the increased pollution are now a major environmental problem in the world. Currently, millions of people in the world suffer from freshwater shortages. Generally, phenol, which is the most important among water pollutants, creates serious environmental problems. So far, many methods have been used to purify phenol from waste water. The use of physical, chemical and biological methods is not tremendous today [5-6]. In the process of chemical processing, intermediate products are obtained, which are harmful to the environment too. Membrane filtration is a unique method for the purification of pollutants from water; currently membrane filtration method is on the focus, as it is an energy efficient and ecologically efficient process for water purification [7]. However, the separation of the toxic substances contained in the water requires other methods. Therefore, the subject of the new methods maintains its relevance.

**II. EXPERIMENTAL**

According to literature data, we can note that, it is possible to extract phenols from waste water based on photochemical reactions by TiO$_2$ nanoparticles. It has also been studied that these nanoparticles generate systems with carbonized and nitrogenous compounds and such systems expands the UV radiation range to the visible region and ultimately reactions in the N/TiO$_2$ participation occur in the visible region; which enhances the practical importance of the reactions[8]. TiO$_2$ nanoparticles are excited only during UV radiation (A<387 nm) and in the visible region, no reactions occur with these nanoparticles (A>400 nm). Because, in the TiO$_2$ compound bonding energy between Ti-O is high, so that, the UV rays cause TiO$_2$ excitement. The reason of process going on in the visible region is based on the fact, in N/TiO$_2$ doped systems the bonded energy between Ti-N is smaller than the bonded energy between Ti-O [9].

TiO$_2$ nanoparticles are very useful; so that, it is chemically stable, easy to handle, non-toxic and ecologically clean [10].

Phenol decomposition reactions were carried out through photochemical reactions using TiO$_2$ nanoparticles and NH$_3$ solution to purify phenol from wastewater. The aim was to determine how effective the new synthesized nitrogen compound is effective in photochemical reactions. For this purpose, 0,05g of TiO$_2$ and NH$_3$.OH in 10 ml of distilled water was prepared. Sanification of the solution is carried out beforehand in order to provide the equal distribution of TiO$_2$ nanoparticles in distilled water.5 ml of taken mixture was added to 20 ml of 1 mg/l of phenol solution, followed by addition of 0,05 g of ammonia and subjected to photochemical dissection in UV-visible region. After the photolysis process, dependent of the wavelength of the absorption coefficient on the reaction solution has been obtained in the UV radiating device and thereby the photolitic dissolution has been proved. In the photolysis process, dependence of the absorption coefficient (Abs) on the wavelength was determined by the “Varian” device the reduction of solids concentration of the phenol remaining in the solution. The reduction of solids...
concentration of the phenol has been determined in the remaining solution after photochemical reaction based on the graphic 1. The process took about 5 hours.

A. Analysis of result

The TiO$_2$ nanoparticles of rutile phase prepared for the process were determined by the TEM method and the results are shown in Figure 1. As shown in figure 1, the obtained nanoparticles are homogeneous and range from 10 to 30 nm, the results are consistent with the calculations of the Sherrer method. The total surface area of the nanoparticles is 159.6 m$^2$/g. TEM results were consistent with XRD results.

Crystallization and purification of TiO$_2$ nanoparticles are determined by the XRD method. Figure 3 shows the X-ray structure of TiO$_2$ nanoparticles which has been the synthesized by us. All XRD signals were determined to correspond to the rutile phase of TiO$_2$. The diameter of the nanoparticles was 10.3 nm according to the Sherrer method (101). The total area of TiO$_2$ was 159.6 m$^2$/g. Specific alerts for TiO$_2$ nanoparticles were -27.90° (110), 36.01 (101), 41.58 (111), 54.71 (211).

According to literature data, the photochemical dissociation of phenol passes through the UV radiation region to the visible region gradually in the doped systems of TiO$_2$ nanoparticles, generated from chemical compounds that stores C or N. That is why, ammonia solution has been used for this purpose that are synthesized by us for the first time and contain both C and N. In the process, it is assumed that the process proceeds to the visible region, based on the reaction between the electron pair of the N atom and TiO$_2$.

20 ml 1 mg/l phenol solution, 5 ml solution in which 0.05 g of TiO$_2$ nanoparticles distributed equally and 0.05 g of ammonia solution were taken for the process.

The pH was determined during the photochemical reaction (1-2; 2-3; 3-4 and 4.5 hours). The dependence of photochemical dissociation on pH was determined too. The pH-change was determined by the PHS-25 pH meter. In the last one the pH of environment was equal to 4.
The dissociation of $\text{N/TiO}_2+\text{Ph}$ is better, when pH=4. The dependence between the dissociation of the phenol solution and pH of the environment is shown below (graph 2).

**Graph 2. Dependence of $\text{N/TiO}_2+\text{phenol}$ solution on the pH**

The article considers the use of nanoparticles in the solution of environmental problems created by waste water. For example, in the last 30-35 years, due to the development of nanotechnology, the pollution of toxic substances from waste water or contamination of waste water is considered to be one of the topical issues. The freshwater resources around the globe is gradually decreasing, so discovering new methods for maximum waste water treatment do not lose its relevance.

### III. RESULTS

1. The dimensions of TiO$_2$ nanoparticles synthesized by us have varied between 10 and 30 nm.
2. TEM results of nanoparticles coincide with the results of XRD.
3. Photochemical reaction of ammonia+TiO$_2$+phenol system in UV-visible area was carried out.
4. In the presence of N/TiO$_2$ in the UV-visible area, the degradation of the phenol was based on the curves drawn on the “Varian” device.
5. pH of environment was equal to 4.
