

Dear readers..!

Science is the product of human mind.Science is the child of intelligence. Science is an idea. We get ahead as long as we are able to think or we stay behind as much as we can't think. We can get power if we make science or this situation will turn into its opposite and we can't have power without making science.

The main goal of human intellect is to produce by its nature. Produced knowledge is power. Science that is the study of production of knowledge is the hardest work in the world. Science that is produced is precious as much as it is understood. Science that cannot be gotten is unfortunately hasn't contributed to scientific progress in time. Understanding and making analysis on science have made the main dynamics of progress in society. Scientists make science and people interested in science read these products. In this point, we can think that to be a follower of science is the brother of making science. Readers who are interested in and follow science have made scientists more precious. We as *Academic History and Thought Magazine* are like bridge between scientists and readers. Moreover, we are the world where there are different thoughts, arguments of different intellects and new derived meanings.This is hard to say that it is such a great feeling and responsibility that we get thinkers and readers together.

For this reason, we are so proud of presenting the 5th magazine with the conscious of responsibility.Finally special thanks to all our respectful writers both from our country and abroad that open the doors of science, referees that make our articles known and identical and readers that are patient to read our products.

Best regards

Hakan Yılmaz

Editor
