Dear colleagues,

We are delighted to welcome you to the final issue of Mucosa in 2020. It is a great pleasure for us to continue publishing our new issues during pandemic period without any interruptions.

In this issue, we have five scientific articles for you. Ozgen and Comert reviewed the cutaneous and mucosal findings after solid organ transplantation in terms of risk factors, precautions, and treatment. In a research article, Issi et al. reported the mucocutaneous complications in children with liver transplantation, and they drew attention to the importance of dermatological examination in these patients. Cebeci et al. reported a patient with lymphangioma circumscriptum of the vulva successfully treated with radiofrequency ablation. They suggest that radiofrequency ablation is a safe and cost-effective treatment for the management of lymphangioma circumscriptum at this specific location. In another case presentation, Hange reported a patient treated with polidocanol sclerotherapy for an intraoral hemangioma. Finally, Ayvaz et al. reported a case with angina bullosa hemorrhagica in order to highlight differential diagnosis of this benign condition.

We would like to thank our readers, authors, and reviewers as well as our publisher for their meritorious contributions. We hope to hear good news for leading indexes next year. We await your valuable contributions for our forthcoming issues.

We wish you a healthy, happy, and successful new year!

Warm regards,

*Savas Yayli*
