Dear Colleagues,

Nice to greet you again in the first issue of this year. Some hope has arisen for having a piece of freedom in the summer with the increased Covid-19 vaccination, though it is not adequate for most of the underdeveloped countries. In this issue, you will find an original article reporting about mid facial fractures and related ocular trauma. They reviewed 68 patients with mid facial fractures who were clinically and radiologically proven. They conclude that ocular injuries are more frequent with complex zygomaticomaxillary fractures and pan facial fractures and interventions may require interdisciplinary collaboration.

A letter to the editor discusses briefly the mucormycosis cases that are on the rise in the pandemic period, which may be a fatal infection in debilitated patients.

There are 2 interesting case reports in this issue. One of them discusses a unique case of pepper ball related ocular injury and its outcome. The other case report discusses an unusual ocular infection case of infection caused by *Edwardsiella tarda*.

Have a nice reading,

Best regards.
